2005 GENERAL REASSESSMENT ASSESSOR'S REFERENCE MATERIALS

. . . . . .

February 2004

Helpful Hints:

This publication represents a selected compilation of materials developed and used by the Real Property Assessment Division of the Office of Tax and Revenue during the 2005 revaluation of real property in the District of Columbia. As such, it does not purport to be an exhaustive collection of all assessment administration documents and materials. Its primary purpose is designed to be a quick reference guide for the real property assessor in his/her day-to-day work activities.

1. The **Table of Contents** allows you to jump directly to any topic in the reference materials by clicking on the topic of interest.

2. To return to the **Table of Contents**, simply click on the page number located in the lower right corner of the document you are viewing. Where pages have been rotated for easier viewing, the page number is located in the lower left corner.

3. Additional navigation options are available at any time by "right-clicking" on a document page.

Please feel free to call or e-mail your comments or suggestions to the contact below. Thank you.

OFFICE OF TAX AND REVEUNE
REAL PROPERTY ASSESSMENT DIVISION
INTEROFFICE MEMORANDUM

TO: REAL PROPERTY ASSESSMENT DIVISION STAFF

FROM: THOMAS W. BRANHAM, CHIEF ASSESSOR

SUBJECT: TY 2005 REASSESSMENT EFFORT

DATE: FEBRUARY 26, 2004

Again, you were asked to put forth a Herculean effort and again you rose to the occasion. Thank you all for confronting this tremendous challenge with such a positive spirit. I am sure it is what enabled us to complete the general reassessment of all real property in the District of Columbia. After last year's general reassessment and another 50% increase in workload, we were sure that the volume had reached the maximum. That is, until we received nearly 12,000 first level appeal applications. No one thought we could handle 12,000 appeal hearings and still complete the annual reassessment. We not only completed the reassessment on time, but for the third year in a row, the assessment notices were mailed to all property owners by the statutorily required deadline. In addition, during the last thirty months you have performed 200% more assessments than were completed in the previous six years all together. Your work did not end with the general reassessment either. You inspected and verified nearly 8,000 sales, inspected approximately 2,000 building permits, resolved 11,586 first level appeals and will respond to 2,511 Board of Real Property Assessments and Appeals (BRPAA) appeals. The degree of difficulty of your task was exacerbated due to the labor intensive demands of the Craig class action law suit and the loss of another four assessors.

I would like to thank all of you again for the tremendous effort you put forth to accomplish the aforementioned tasks. All 173,000 notices were mailed February 26, 2004. Remember that two events have contributed to the large increase in assessments that property owners are experiencing this year. First, the return to an annual assessment program means that there is no longer a phase-in of the proposed assessment as was the case in the triennial assessment program. And second, we are in the midst of the most rapidly appreciating real estate market that Washington, D.C. has experienced in more than two decades.

As the taxpayers begin to receive their notices, the telephone calls will come and the questions will begin pouring in. Let me just take a minute to remind each of you to provide sensitive, prompt, courteous and informative customer service. As I said last year, the best advice I can give in this regard is to always treat the customer the way you would hope to be treated if you were in their position. An ability to respond to inquiries in a knowledgeable and cordial manner is crucial to providing excellent customer service. These recent changes in tax policy were not at the property owners' request and they may be more upset than usual. Please be patient. The City Council recently responded to the reaction of the District's taxpayers by passing legislation that limits the annual property tax increase for an individual property.

Let's turn our attention to the various processes utilized this year to produce the TY 2005 assessed values. This year marked the third reassessment period in which our Computer Assisted Mass Appraisal system (CAMA) was used in the valuation process. Substantially more property-specific appraisals were prepared compared to last year. Last year there were 106,231 property-specific appraisals done and this year over 132,811 parcels were valued property-specific. Your efforts in the sales verification process supplied valuable data to the CAMA modeling and calibration process that assisted the CAMA models with accurate estimates of market values. Of course, we owe a great deal of gratitude to William Nelson and Robert Gloudemans, for their assistance with the model development, calibration and the review process. We achieved improvement in the assessment process, final values and uniformity. As time progresses, this process will improve and thus improve both the quantity and quality of property-specific appraisals we conduct.

Listed below is the breakdown of the appraisal methodology used for TY 2005 for the various types of property in the District:

Residential – market-oriented cost approach: 70,006 properties
Residential – market-trending methodology: 39,274 properties.

Condominiums – market-based MRA: 36,921 properties
(332 cooperatives).

Commercial – income and market approaches: 7,135 properties
Commercial – cost approach to value: 10,924 properties.

Major properties – income approach to value: 7,825.

One of the results of more property-specific valuations may be questions from property owners asking why one person's property value may be different from their neighbor's property. Or, why did my neighbor's property go up only 15%

and mine went up 35%? These are legitimate questions and we need to be prepared to answer them with knowledge, understanding and accuracy. Any time a taxpayer feels concerned about his/her value, please encourage them to file an appeal. As always, the appeal-filing deadline is April 1 and applications are on the Website, at District public libraries, fire stations and in the customer services area. Property owners may appeal by sending a letter requesting a first level appeal also.

District-wide, the values of property increased, on average, 12.2% over their prior year's assessment. The rate of appreciation is still in double digits for most property in the District.

Our overall goal is to uniformly and equitably assess all properties in the District, based on market-derived valuation techniques, whether they be the market-calibrated cost approach, the income capitalization, multiple regression analysis or time trending. All of these methods and techniques are authorized in D.C. Municipal Regulations 9–307.2. I would like to take a moment and discuss these various appraisal methodologies. I am sure many questions will be asked about "how" we arrived at our values. A brief description of the methods used this year to value property is shown below and a more detailed discussion follows. ***Each method was selected based on its ability to provide the most accurate assessment and/or generate improved results over the previous year:***

A. Trending – A mass appraisal technique where one adjusts (sub) neighborhood values stratified by use code for the effect of time. The prior year's values are multiplied by a trending factor to account for the appreciation (depreciation) that has occurred in the neighborhood since the last reassessment. The District is economically, socially and geographically divided into 139 sub-neighborhoods. It is further divided into numerous property types and use codes for valuation purposes. If, for example, market data indicates that sub-neighborhood 'A', Property type, single family detached has appreciated 25% in the past year, then last year's value of $200,000 would be trended to $250,000 ($200,000* 1.25).

B. Market-oriented cost approach – A mass appraisal technique where the estimated cost to construct a new improvement is determined and from that, an appropriate amount of depreciation is deducted. The resulting value is then added to the land value to arrive at the total assessed value of the property. Instead of relying on traditional cost tables, the market-oriented approach refines the process by using actual market-derived costs. Extensive analysis of market sales data and property characteristics generate the appropriate values for the components of the improvements. For example, a traditional cost table may list a fireplace value as $5,000, whereas the DC market may indicate a fireplace adds $7,500 value to the improvement.

C. Multiple Regression Analysis (MRA) –A mass-appraisal technique used to predict, or estimate, the market value of property. Through statistical analysis of properties that have recently sold, MRA develops the relationship between various property components and the value they contribute to the sale price. The process estimates the contributory value of such components as the size of the house, the number of bathrooms, the number of bedrooms and other components that may contribute to the sale price of the house. As an example, let us say that several sales in a neighborhood reliably indicate the contributory value of one full bath is $15,000 and houses with two full baths is $45,000. When estimating the value of a house containing two full baths, one-value component would be $45,000 to account for the baths. The full market value estimation would be the total contributory value of all those value components identified in the house whose value is being predicted.

D. Income approach – A commercial property appraisal technique, where net operating income is converted in an estimate of value using a process called capitalization. The technique is usually property-specific; however, many of the variables (market rent, expense ratios, capitalization rates) are derived from market sales analysis. RPAD's *Pertinent Data Book* summarizes the annual analysis of the DC commercial sales and economic data that becomes the basis for the income approach to value.

Preliminary results of the Assessment / Sales Ratio Study conclude that city-wide, residential properties are being assessed at 95% of their selling price with acceptable dispersion. The commercial properties are being assessed at 93.2% of their selling price. A more complete summary of the study is included in the reference materials that follow.

The next several sections will provide more detail regarding the actual steps taken in the reassessment. **Again, thank you for your incredible contribution to the District's annual reassessment program.**

Explanation of Residential Market-oriented Cost Method

Note: The market-oriented cost approach to valuation is further explained and illustrated in the document, *Vision Residential Valuation Process*.

The market-oriented cost approach involved the following:

1. Extracting the CAMA data of qualified sales and importing it into SPSS.
2. Replicating the existing CAMA cost model to ensure that the same land and improvement values could be produced in SPSS.
3. Building a preliminary regression model that reflected the variables of the CAMA cost approach.
4. Reviewing the results of the preliminary regression to identify candidate market areas where the data was such to allow for successful regression analysis.
5. Eliminating outliers in the candidate areas to better ensure accuracy of the regression results.
6. Establishing time adjustment factors in order to analyze sale prices as of a specific point in time. The city was divided into 4 major market areas for time adjusting sale prices. Market data indicated monthly time adjustment factors over 32 months (1/1/2001 through 8/31/2003) as follows:

	1/1/2001 – 8/31/2002	9/1/2002 – 8/31/2003
"Southeast" Neighborhoods: (2, 3, 16, 22, 28, 33, 43)	+ 0.90% per month	+ 1.20% per month
"Northeast" Neighborhoods: (5, 7, 12, 14, 17, 32, 35, 36, 42, 47, 48, 51, 52, 56)	+ 1.20% per month	+ 1.50% per month
"Northwest" Neighborhoods: (1, 4, 8, 11, 13, 21, 23, 24, 25, 26, 27, 29, 30, 34, 37, 38, 41, 50, 53, 54, 55)	+ 1.25% per month	+ 0.85% per month
"Downtown" Neighborhoods: (9, 10, 20, 39, 40, 46)	+ 1.55% per month	+ 0.95% per month

7. Building a final regression model, using the time-adjusted sale price as the dependant variable.
8. Calibrating that model using non-linear multiple regression. Variables were included to extract land values from the market.
9. Reviewing the regression predicted values and removing extreme outliers.
10. Examining the predicted-values-to-time-adjusted-sale-price ratios for equitability with respect to lot size, building area, age, use, grade, and location.
11. Entering the coefficients indicated by the regression analysis back into the CAMA program's cost model.
12. Applying the cost model in CAMA and reviewing the resulting values to ensure they agreed with the predicted values produced by the regression.
13. Performing sales analysis to determine if acceptable levels of assessment were achieved, and adjusting rates as necessary.
14. Applying model to inventory and producing percent change reports for assessor review.
15. Incorporating oversight of the computer aided procedure by our professional staff cited in the *2005 Valuation Review Process*. All projected market value changes are submitted to the staff for their review, refinement, and adjustments.

Explanation of Residential Trending Method

The Trending process consists of the following steps:

1. Compiling and analyzing qualified sales data for the subject market areas; the sales included in the analysis occurred over a period of two full years from January 2002 to December 2003.

2. Stratifying the sales by neighborhood, sub-neighborhood, use code and sale year (see the table titled *1/10/04: NBHDs to Trend by Use*).

3. Examining the mean and median sale price, assessment, assessment-to-sale ratio, and sale-to-assessment ratio within each stratification. The median sale-to-assessment ratio is effectively the indicated trend factor.

4. Selecting a market-derived trend factor for each use code within a sub-neighborhood. The selection is based on the 2003 indicated trend factor, but it is considered in the context of the other available data (see the table titled *Residential Trend Factors*).

5. Stratifying all properties, sales and non-sales, in the subject market areas by neighborhood, or sub-neighborhood, and use code.

6. Uniformly applying the appropriate market-derived trend factor to each property's current assessed value to establish a proposed assessment for 2005.

7. Incorporating oversight by our professional staff cited in the *2005 Valuation Review Process*. All projected market value changes are submitted to the staff for their review, refinement and adjustment. This is the final step toward our goals of uniformity, equity and fairness.

Land Valuation in Trended Neighborhoods:

The selected trend factors were applied to the current total assessment of the properties in the subject areas:

2004 Assessment * Selected Trend Factor = 2005 Assessment

The land values were established based on an analysis of the market data contained in the table *Land Rate Analysis For Non-modeled NBHDs*. Standard lot sizes were established for each subject area, except 39 (A, B, C, F, G, H, L) and 40 (A, B), where standard lot sizes were established during the 2003 reassessment. Land rates were then derived based on market data, by estimating an appropriate land-to-building (L-T-B) ratio, and dividing the indicated land values by the standard lot sizes. Finally, the Group 1 land curve, established in the regression modeling analysis, was applied to each of the subject areas to adjust the land rates for lot size.

Explanation of Residential Condominium Valuation Methods

To determine what method was used for a particular regime, refer to list titled *Residential Condominium Regime Valuation Method*.

Regression:

The sales comparison approach using multiple regression analysis involved the following:

1. Extracting the CAMA data of qualified sales and importing it into SPSS.
2. Reviewing data to determine what regimes were candidates for regression analysis. As a rule, regimes could be valued using regression where the physical data attributes were complete and adequate sales data existed. Regimes without adequate sales, but with complete data, could be clustered with regimes having similar profiles to allow regression to be used.
3. Exploring the data to determine what variables would likely contribute to the model.
4. Building a base model.
5. Reviewing the results of the base model and eliminating outliers in the candidate regimes to better ensure the accuracy of the regression results.
6. Establishing time adjustment factors in order to analyze sale prices as of a specific point in time. Market data indicated a citywide monthly time adjustment factor over 32 months (1/1/2001 through 8/31/2003) of 1.50% per month.
7. Building a final regression model, using the time-adjusted sale price as the dependant variable.
8. Calibrating that model using multiple regression analysis.
9. Applying the model to the sales, reviewing the predicted values and removing extreme outliers.
10. Performing sales analysis to determine if acceptable levels of assessment were achieved, and adjusting rates as necessary.
11. Extracting condominium inventory data and importing into SPSS.
12. Applying model to inventory, and exporting the values back to CAMA, allocating 30% of predicted value to land and 70% of predicted values to improvements.
13. Producing percent change reports for assessor review.
14. Identifying necessary corrections to data and location adjustments.
15. Repeating process of extracting data, applying model, and exporting back to CAMA to include corrections.

The Condominium Regression Model:

ESP= 339.59 * SIZE * SIZE_ADJ * COND_ADJ * VIEW_ADJ * BATH_ADJ * PARK_ADJ * LOC_ADJ.

Estimated Sale Price (ESP) – the value predicted by the model for the parcel, given the variables in the model, the coefficients of those variables and the attributes of the subject unit.

Base Rate (339.59) – base size rate (constant)

Size – the square footage of the unit

Size Adj. – the adjustment for the unit's size being larger or smaller than the base size

The base unit size is 800 sf. The formula for calculating the size adjustment is: $((SIZE^{.874})/SIZE)/.431$, where $.431 = (800^{.874})/800$. See graph titled *Condominium Size Curve*.

Condition – adjustment for the unit's physical condition

(1) Poor	.936
(2) Fair	.936
(3) Average	1.000
(4) Good	1.061
(5) Very Good	1.140
(6) Excellent	1.145

View – adjustment for the unit's view

(1) Poor	.879
(2) Fair	.935
(3) Average	1.000
(4) Good	1.027
(5) Very Good	1.042
(6) Excellent	1.110

Bath Adj. – adjustment for the unit's number of full baths more than one.

BATH_ADJ = ((FULLBATH-1) * .055) + 1

Example: *2 baths: ((2 – 1) * .055) + 1 = 1.055*
*3 baths: ((3 – 1) * .055) + 1 = 1.11*

Parking – adjustment for Limited Common Element parking

	Outdoor	Indoor
1 space	1.075	1.119
2 (or more) spaces	1.135	1.182

Location – adjustment for unit's geographic location

Location adjustments were made for neighborhood, sub-neighborhood, cluster of regimes, or unique regime. The actual location adjustment for any unit may be the combination of one or more of those location factors.

Assessor Valuation:

A small number of regimes were not candidates for regression because part or all of the data variables required by the model were not present, or special conditions existed that precluded application of the regression model. Regimes that were new for 1st Half 2004 also were not valued by the regression model. In these cases, the assessors assigned to those regimes conducted their own analysis of the available data and valued the units in those regimes. When possible, they also collected the information that was lacking, so that in coming years, those regimes will become candidates for regression analysis.

Final Assessor Review:

At the conclusion of the valuation, several reports are produced showing the results of the reassessment. These reports, reflecting proposed market value changes, are submitted to the assessment staff for their review, refinement and adjustment in accordance with the processes outlined in the *2005 Valuation Review Process* document.

Explanation of Cooperative Valuation Method

Cooperatives are a type of residential property. In a cooperative, a corporation owns a property and the shareholders can use the unit or units represented by their shares. In Washington, DC cooperatives are assessed according to statue by either of two methods. The first method is by calculating the cumulative value of the leasehold interests (by sales). The second method is to treat the project as if it was a condominium project and reduce the value by 30%. After arriving at either of these values you further reduce the value an additional 35%.

The cooperatives in the district had not been reassessed from 1997 - 2002. During this period there was an assessment freeze for several years and after the freeze we did not have access to sales information to make good evaluations. For the reassessment for 2002 it was decided to increase the values by the indexes used by residential properties in their neighborhoods. After the review we were able to collect sales information from MRIS. Using this information we were able to review the appealed properties and review the next years group.

For 2005, we reviewed all the complexes with sales information and calculated the sales prices per square foot after factoring in the time adjustment. Matched pairs sales were used to calculate the typical percentage increase per month. We were surprised to discover that in the better complexes the trend from 1999 - 2002 was approximately 3% per month. In other words units that sold in 1999 would sell for about twice as much in 2002. In 2003 the market began to cool although sales prices were still increasing by 1-2% per month in many complexes. Multiplying the square footage of the units by the adjusted rates (occasionally they were adjusted for view or parking as sales indicated) would result in the aggregate values which were further reduced for personal property and the result multiplied by 65%.

In complexes where there were no sales we treated them as if they were condominiums. To do this we would find a condominium as similar as possible to the subject and use the square foot rate that seemed to be appropriate to the square foot of the units or the estimated square footage. We would multiply the rate times the square footage and reduce the result by 30% and then by 35%. The complexes without sales were usually limited - equity coops or very small complexes.

2005 Valuation Review Process

As part of the CAMA valuation process, initial assessments for all residential properties will be estimated and preliminary reports will be generated summarizing the results of the valuation effort. Your review, modification and approval of the proposed assessments indicate that they are representative of the estimated market value.

The Valuation Review Process is designed to allow for a thorough review of the new values for the upcoming tax year before notices are sent to property owners. The purpose of this review is two-fold. First, it allows us the opportunity to correct any errors that may have occurred in the valuation process before they cause administrative difficulties (i.e. public relations problems, unnecessary appeal activity, and the like). Second, the process provides feedback to the CAMA modeling and calibration process.

The process involves examining all assessments with particular attention given to the outliers in a relatively short period. As such, the assessor is primarily concerned with arriving at a reasonable final value estimate for the accounts on the outlier list, known as the Old-to-New Report. Briefly, the process involves the assessor of record reviewing a selected group of properties in their neighborhood that, on first inspection, appear to be over or under appraised based on previously determined criteria such as sales price, percent change reports, etc. When this review indicates correct values, no records are changed, however, if the value requires modification, the assessor will make changes in the CAMA record and on the PRC to correct the situation. If he/she discovers minor discrepancies in the data, it should be noted and revisited during another inspection program. The purpose of this program is not to engage in a detailed analysis of accounts but rather to expeditiously review outlier accounts to improve our estimate of market value.

> **NOTE**: It is advisable that the assessor has a solid knowledge of CAMA valuation before proceeding with the review process. Several significant changes have been made to the residential valuation model for the 2005 valuation. Please refer to *the "2005 CAMA Residential Construction Valuation Guideline"* for a summary of these changes. Along with the report entitled “VISION CAMA Valuation,” the guideline will serve as a tutorial for the methodology employed within CAMA for valuing residential property.

Following are some general guidelines to consider while conducting review activity.

1. The valuation review process begins with CAMA producing two reports for each (sub)neighborhood. The first report is the “Old to New” report that shows the old value, new value, percent and dollar change in value from

the current assessment to the proposed assessment for specific properties that constitute outliers in the (sub)neighborhood. Included are the individual PRCs for each corresponding account listed in the report that increased 25 percentage points more than the median increase for the (sub)neighborhood or decreased more than 10 percent. The second report, Percent Change Detail Analysis, contains more specific detail about all of the accounts in the selected (sub)neighborhood.

2. The assessor will be provided these two individual reports for each of the assigned (sub)neighborhoods, along with individual PRCs from the Old-to-New report.

3. Before individual reviews of the Old to New report begins, the assessor will examine the Percent Change Detail Analysis report for signs of irregularities or general discrepancies based on their knowledge of their neighborhoods. The review entails several tasks as follows:

    A. Review the "A/S Ratio", when present. The ratios are calculated based on sales over a long period of time. Pay particular attention to sales that occurred during 2001 – 2003. These sales will give a better picture of the actual assessment/sales ratio. Where the assessed values are not close to the sales prices, fully examine the record, and consider making appropriate changes. The assessor will notice many of the ratios exceed 100%. This will often occur because the sale price used to calculate the ratio has not been time adjusted to the present. On average, the amount of time adjustment will range between 1 and 1.3 percent per month. As the age of the sale increases, the likelihood of an apparently high A/S ratio also increases. This is to be expected.

    B. Examine the "Grade" of the accounts. If there is a two or more departure of grade between the account and the typical grade in the (sub) neighborhood, the assessor may be concerned.

    C. Look for extremes in the "Cond" and "% Good" data. Again, on average, these should be relatively consistent throughout the (sub)neighborhood.

The preferred process to follow when conducting individual reviews of accounts contained on the Old-to-New report is as follows:

1. The assessor will examine each record that appears on the "Old to New" report. Each record has been selected for inclusion because the value change from last year to this year has dropped or is more than 25 percent points greater than the median increase for the (sub)neighborhood.

These records constitute the "outliers" of the (sub)neighborhood. The values may be correct or erroneous, and the purpose of this process is to make that determination.

2. The assessor, exercising his or her professional skill and judgement, first will conduct a "desk review" of each account appearing on the report. If the value does not seem reasonable perform the following actions:

    A. Examine the PRC for any missing or incorrectly coded data contained in the Construction Detail section.

    B. In the Building Summary Section, check the sq. ft. sizes of the areas listed for accuracy and reasonableness.

    C. Check the Building Cost Section for correct *Effective Area*, *Special Feature RCN and % Good.* If any are erroneous, examine their respective sections for details.

    D. Examine the Special Features/Amenities and Detached Structures sections for accuracy.

    E. On the front of the PRC, check the Land Line Valuation Section for proper size and value.

    F. Make use of the Pictometry tool available in the Mapping Apps folder.

3. Three results may occur from the desk review:

    A. The desk review indicates the value is correct. In this case, note in the column adjacent to the account "OK", your initials and the date.

    B. The desk review indicates an erroneous value discovered by examining various reports and records (i.e. Percent Change, CAMA record, etc). In this case, the assessor makes the correction in the CAMA record, notes the changes made on the PRC in red, notes on the OTN report the new amount, your initials and the date.

    C. The desk review is inconclusive and a field inspection is in order.

An example may help illustrate scenario "A", the first situation. Let's say the Old-to-New report indicates an account has jumped 400%, from $300,000 to $1,200,000! That amount of increase seems absolutely erroneous. To determine a possible explanation, the assessor begins the review by locating the account on the Percent Change Detail Analysis report. After finding the account,

the assessor notices that the properties close to the account have only increased by approximately 40%, the median for the neighborhood. They are approximately similar to the account in size, grade, and condition, but their prior year's value was $900,000, while the outlier was only $300,000. The assessor would be safe to conclude that the account was grossly under-assessed last year. The low "old" value caused the large increase in value, not an over-assessed new value. To complete the desk review, the assessor notes on the Old-to-New report, "OK", his/her initials and the date.

Scenario "B", the second situation, may find the assessor reviewing an account that also appears to be over-assessed based on the large increase from old to new value. The assessor again locates the account on the Percent Change Detail Analysis report and reviews the account in context to other (sub)neighborhood properties. The assessor discovers that most of the data about the account is similar to the other properties – same use code, similar size, percent good, etc. However, where most of the properties are listed at Grade 4, the account is Grade 7. This would help explain the likelihood that the account is over-assessed. The assessor would make the change to the grade in the CAMA system, note the new value, make the change on the PRC in red, and document the change on the Old-to-New report by writing the new value, his/her initials and the date in the far right column of the report next to the account.

The last scenario, "C", results when the assessor can not immediately explain the reason an account appears on the Old-to-New report. He/she should set aside accounts that will require field inspection and at a point, go to the field for inspection. Upon conclusion of the inspection, the assessor will document the results in a similar manner to the desk reviews. The actual schedule for field-work will vary and will be coordinated by the assessor and his/her supervisor.

Market Approach to Land Valuation in Costed Neighborhoods

A non-linear regression model was used to calibrate the residential cost model. It was developed from citywide market analysis of qualified sales. One of the variables calibrated by the model was the land rate. Base land rates were adjusted for location in each sub-neighborhood. Regression analysis calibrated the land and building components of the model at the same time using the same market data. Additionally, the analysis established three size curves for land area. Each land size curve indicates that as lot sizes increase, lot values also increase. However, with each land size curve, values increase at different rates as the land size ratio changes (land size ratio is the lot size / base lot size). In each case, land rates decrease as land area increases. Market data supports the curves up to approximately 5 - 6 times the standard lot size. However, in application, rates are assumed to continue similar decreases beyond that point. Each sub-neighborhood was assigned to one of the three land size curve groups based upon analysis of the qualified sales data (a fourth curve was established specifically for neighborhood 25H, which fit best between curve 2 and curve 3). The table that follows, *Residential Base Land Rates by Neighborhood*, indicates the base rates, base lot size, and size curve for each neighborhood. The graph that follows, *Residential Land Size Curves*, illustrates how land values change as the land size ratio changes.

Land value is only one of a number of variables that contribute to a property's sale price and/or estimated market value. In practical terms, it is the combination of all of a property's attributes, nuances in the market, and buyer preference that contribute to the final market value of a property. It is difficult to isolate some of the contributory elements and value them separately with certainty. Nevertheless, it is required in the District of Columbia that land and building values be separated for assessment purposes. Because of this requirement, it is necessary to create land rate tables for use in the District's CAMA product. These rates were developed in the regression analysis referred to above. The results of the analysis are applied to the market-oriented cost model in the CAMA system.

Land is calculated in the CAMA program using the following algorithm:

Area * (Base Rate * Size Adj * % Special Adj 1 * % Special Adj 2 + $ Special Adj 1 + $ Special Adj 2)

Where:

Area is the lot size expressed in square feet.

Base Rate is the market-derived rate for each sub-neighborhood.

Size Adj is the market-derived adjustment made for the lot size as it relates to the standard size lot for the sub-neighborhood. The look-up along the size curve is based on the ratio of the subject lot size to the standard lot size.

% Special Adj is any adjustment present that is expressed and applied as a percentage adjustment to the rate.

$ Special Adj is any adjustment present that is expressed and applied as a dollar adjustment to the rate.

Land Rate Development Example

A hypothetical example may help illustrate how regression analysis develops the base land rates and subsequent adjustments to the rates. Suppose two properties in a neighborhood were recently sold. The first, comprised of just a house without land, sold for $400,000. The second property had the identical house but with a lot of 2,000 square feet (sf.), the typical size for that neighborhood. It sold for $600,000. In a process similar to adjusting comparables in the sales comparison approach to value, regression analysis identifies the contributory value of the lot to the second property and sets its value to $200,000. The base land rate of $100 per sf ($200,000/2,000 sf) will be the basis for lot values for all other properties in that (sub)neighborhood.

Next, let us assume another house sells. In this instance, the house is identical to the previous sale in all respects, except the lot size was 4,000 sf instead of the "standard" (base lot) size of 2,000 sf. This house recently sold for $700,000, $100,000 more than a property with the standard lot size. The land component of this sale is $300,000. This sale helps develop size adjustments for non-standard lots in the neighborhood. If no adjustment was made to the land rate, the land component of this sale would be $400,000 (4,000 sf * $100). The appraisal would overstate the value of the property by $100,000. An adjustment to the base land rate is necessary to recognize the market response to the departure from the standard lot size. Regression analysis would calculate the appropriate land size adjustment necessary to properly determine the contributory value of the larger lot. Dividing the market-indicated value of the lot by the unadjusted appraised value of the lot ($300,000/$400,000) yields a factor of 0.75. In this example, CAMA would follow the model:

Appraised land value = Area * (Base Rate * Size Adj)

or

$300,000= 4000sf * ($100 * .75)

Residential Base Land Rates By Neighborhood

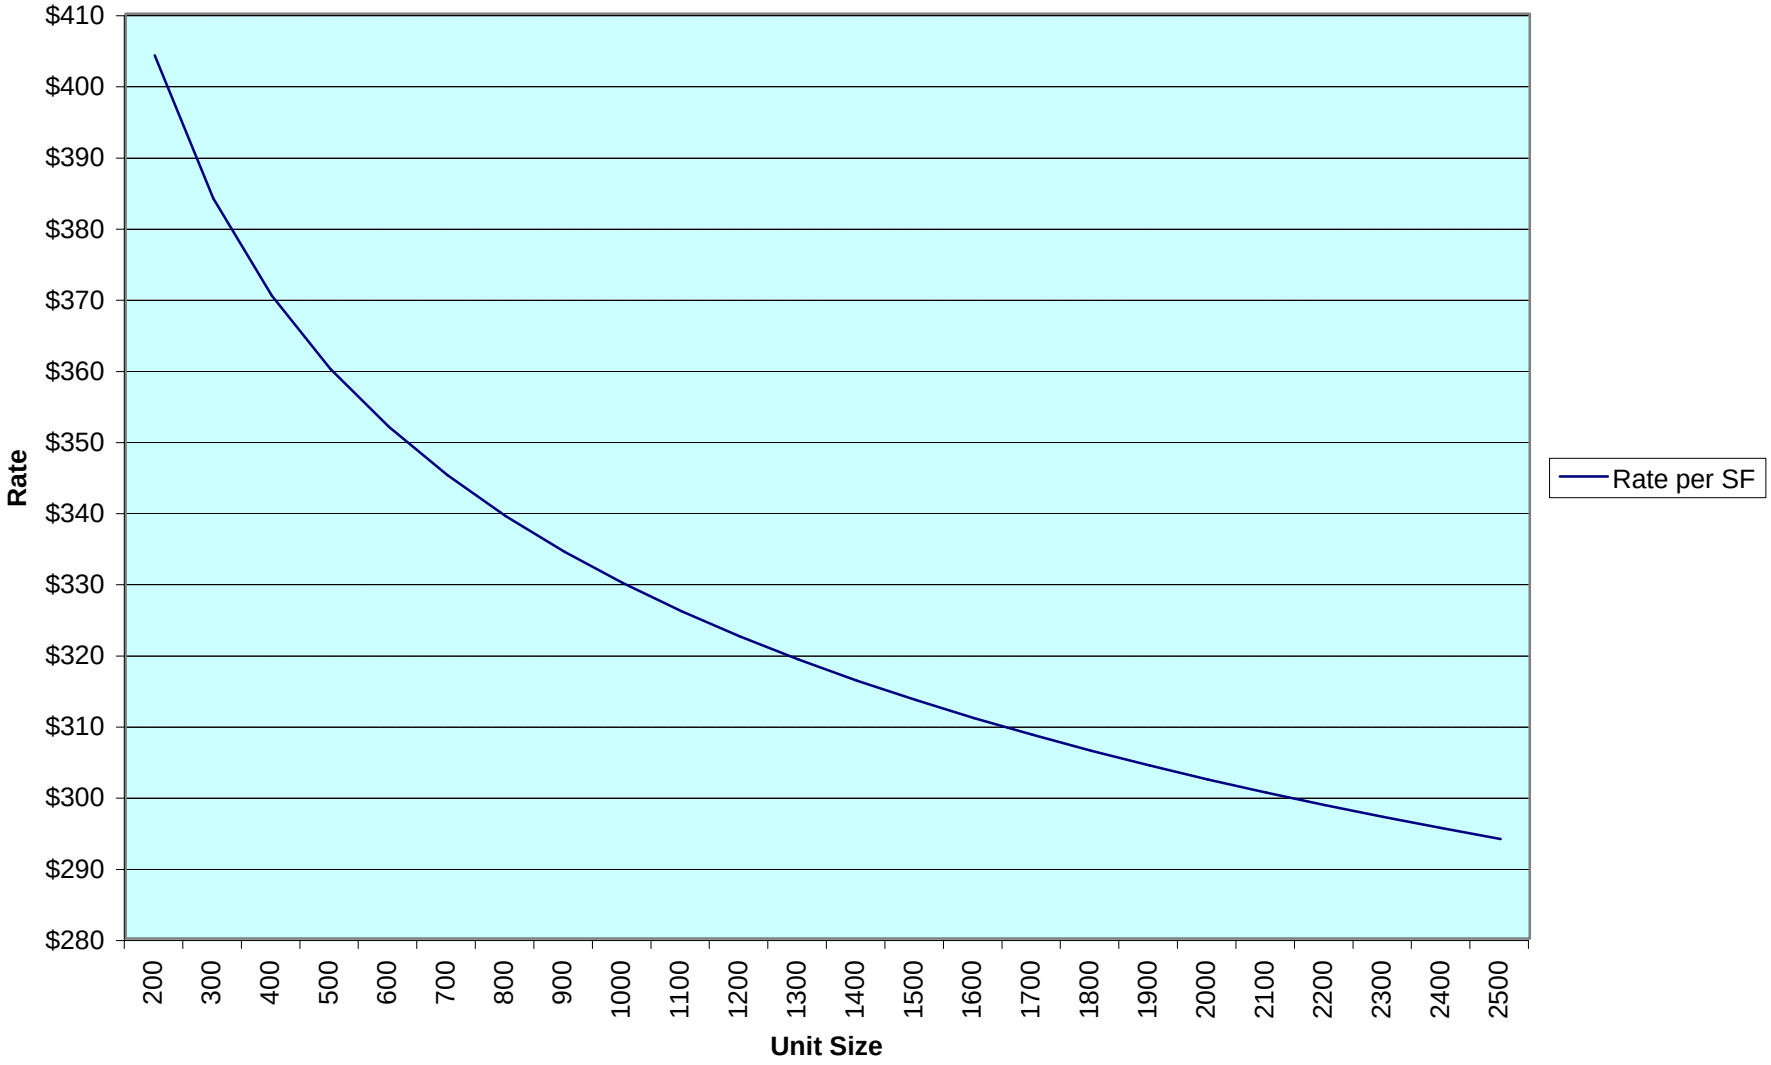
Condominium Size Curve



2005 Vision CAMA Residential Valuation Process

The market-derived cost approach to the valuation of real estate follows the generic formula of **Market Value = ((RCN-LD) + land value)**, where **RCN** is Replacement Cost New of the improvements and **LD** means Less Depreciation. When properly developed and calibrated, this approach is a reliable indicator of market value especially suited to mass-appraisal CAMA systems.

The following exercise will attempt to illustrate how the Vision© CAMA system utilized by the District of Columbia, calculates values using the above model. The first portion will illustrate the development of the Replacement Cost New of a typical residence, and the last portion will show the steps involved in determining the amount of depreciation that has accrued to the residence. Land valuation is not discussed in this exercise.

Replacement Cost New

The Vision© CAMA system arrives at a RCN value for residential properties based on a market-calibrated hybrid cost model. The hybrid nature of the model simply means that the model employs both additive and multiplicative variables in its design and specification. The nature of the model will become clearer as we proceed through this exercise. Please also be aware that a model is dynamic in both its specifications and calibration. The specifications, those cost elements that comprise the model, may change from time to time based upon research and market conditions. As you may discover, the dollar rates, or calibrations, contained here most likely are different from the current model in use. The model used in this exercise is as follows:

Building RCN = [(Base Rate + å $ABRV_n$) * Effective Area * Size Adjustment + å $AFRV_n$] * (MV_0 * MV_2 * … * MV_n)

Where:
RCN = Replacement Cost New
Base Rate = $ rate based on use code
ABRV = Additive Base Rate Variables
Effective Area = Adjusted SF area of improvement
Size Adjustment = Adjustment factor for deviation from base size
AFRV = Additive Flat Rate Variables
MV = Multiplicative Variables

Several items will be helpful while examining the features of the cost model and they are collected as Appendix “A” of this document. You will need to refer to them often during this exercise. They include the following:

- Sample home’s Property Record Card (PRC)
- Cost.dat printout of the sample home
- 2005 CAMA Residential Construction Valuation Guideline

1. First, let's illustrate the calculation of the Effective Area of our sample home.

Building RCN = [(Base Rate + å ABRV$_n$) * Effective Area * Size Adjustment + å AFRV$_n$] * (MV$_0$ * MV$_2$ * … * MV$_n$)

Illustration 1 shows the CAMA sketch of the sample home we'll be using throughout this exercise.

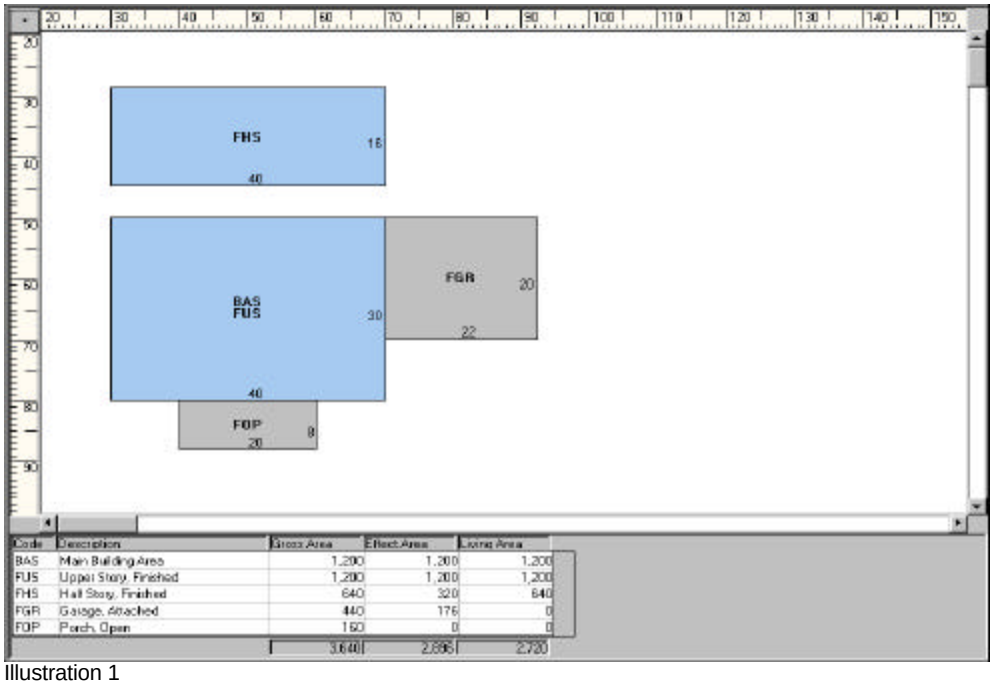


Illustration 1

It is described as a 2½ story single-family detached residence. It is brick veneer, frame construction with a two-car garage and small porch across the front. The bottom of the sketch screen in CAMA provides the information about the sizes of the various areas of the house.

Code	Description	Gross Area	Effect.Area	Living Area
BAS	Main Building Area	1,200	1,200	1,200
FUS	Upper Story, Finished	1,200	1,200	1,200
FHS	Half Story, Finished	640	320	640
FGR	Garage, Attached	440	176	0
FOP	Porch, Open	160	0	0
		3,640	2,896	2,720

Illustration 2

The Effective Area is comprised of the totals of the base area (Main Building Area @ 1,200 SF), the finished second floor area (Upper Story, Finished @ 1,200 SF), the adjusted area of the finished half story (Half Story, Finished @ 50% of 640), and the adjusted area of the garage (Garage @ 40% of 440 SF).

The adjustments to the finished half story and garage take into account these areas are not as expensive as the finished main building area. For example, if

the base rate for the finished main building area is $100/SF, the rate for the garage area may only be $40/SF. The RCN value of the garage would be calculated as follows:

RCN of Garage = $17,600 or (440 SF * $40)

Another way to state the same situation is to adjust the size of the garage to 40% of its measured size and then multiply the resulting, *or effective*, size by the base rate of $100/SF:

RCN of Garage = $17,600 or [(440 * .40) * $100]

Both methods arrive at the same value for the garage. The first method is more intuitive and easier to explain to taxpayers as it adjusts for the differences in costs for the various areas. The second method again provides the same results but is much easier to model and calculate within a CAMA system, thus the effective area calculations shown here represent the methodology employed in the Vision© CAMA system.

The Gross Area shown in Illustration 2 is the total unadjusted size of all the areas that are a part of, and attached to, the home. The Living Area is the unadjusted size of the actual finished living area of the home.

The porch, while attached to the home, is not included in the Effective Area, but is listed as a Special Building Feature and valued separately. See illustration 3 below.

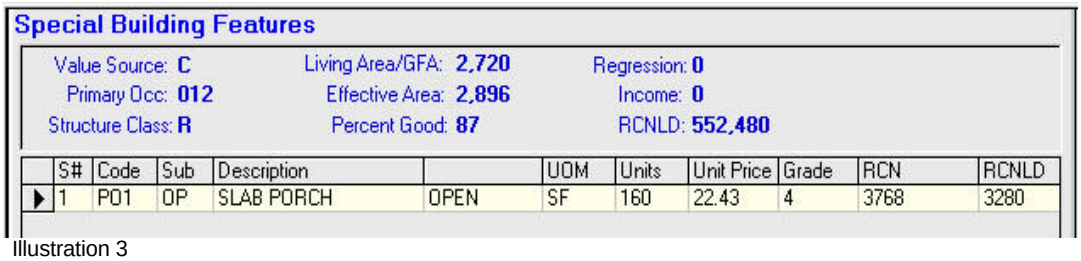

Illustration 3

With the inclusion of the Effective Area calculation, our cost model now looks like this:

Building RCN = [(Base Rate + å $ABRV_n$) * *2,896* * Size Adjustment
Effective Area
+ å $AFRV_n$] * (MV_0 * MV_2 * … * MV_n)

2. Next, let's look at the selection of the Base Rate for the sample home.

Building RCN = [(Base Rate + å $ABRV_n$) * Effective Area * Size Adjustment + å $AFRV_n$] * (MV_0 * MV_2 * … * MV_n)

The Base Rate is the dollar rate per square foot used in the valuation model that is derived from market analysis and selected based on the Use Code of the building. Our sample home is a "Use Code 012 - Detached", corresponding to a Residential-Detached–Single Family residence. The Base Rate is automatically selected by the CAMA system and the appropriate base rate for the sample home is $ 123.26. Now the cost model looks like this:

Building RCN = [(*$123.26* + å ABRV$_n$) * *2,896* * Size Adjustment
Base Rate **Effective Area**
+ å AFRV$_n$] * (MV$_0$ * MV$_2$ * … * MV$_n$)

3. The Base Rate of the home is just the start of the valuation process and it will be further modified as more specific features about the home are taken into consideration. Let's look at the first of two types of modifications that will affect the Base Rate, the Additive Base Rate Variables (ABRV).

Building RCN = [(Base Rate + å ABRV$_n$) * Effective Area * Size Adjustment + å AFRV$_n$] * (MV$_0$ * MV$_2$ * … * MV$_n$)

Additive Base Rate Variables represent a variety of features found in residential improvements. For example, the value for air conditioning and floor covering are such features. The typical characteristic of these ABRVs is that the features are usually an integral part, and therefore an integral cost, of the whole house. As such, the value of the particular ABRV is added to the Base Rate. Each ABRV incrementally increases the Base Rate by its own square foot rate. So therefore, the **å ABRV$_n$** literally means the sum of all the rates for individual features are added to the Base Rate.

Highlighted in Illustration 4 are all the fields in the Construction Detail CAMA screen that can modify the selected Base Rate as ABRVs.

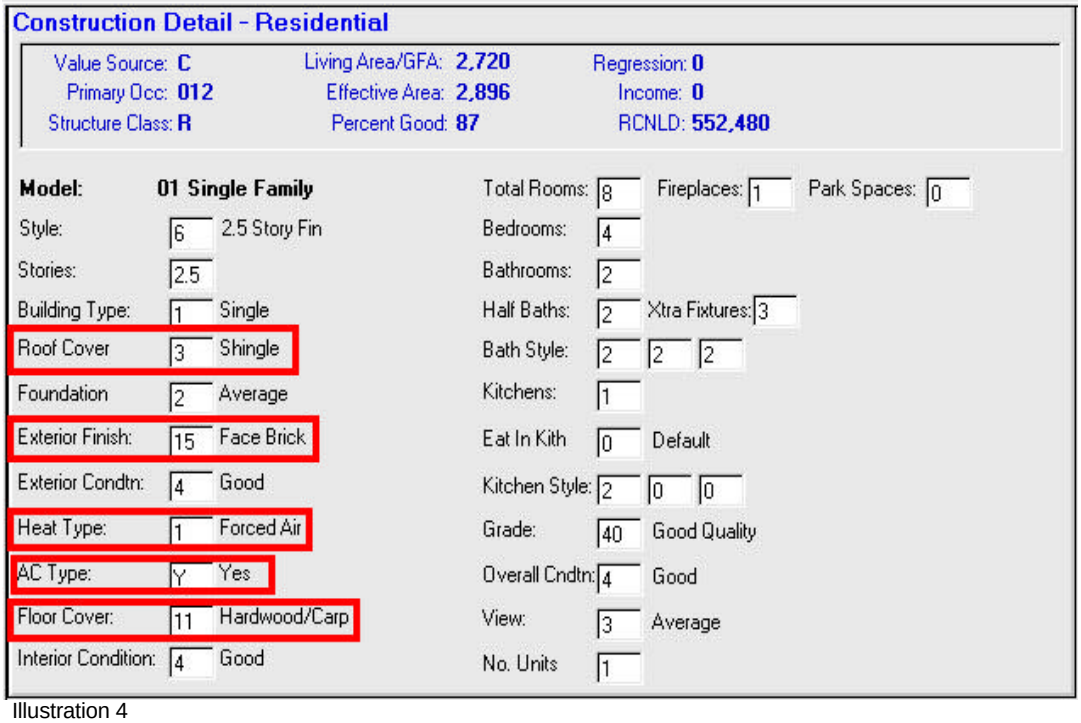

Illustration 4

The Cost.dat sheet of our sample home lists each ABRV under the heading Base Rate Adjustments as follows:

**********Base Rate Adjustments**********
AIR CONDITIONING Y (Yes) = 1.8 + BaseRate
EXTERIOR WALL 15 (Face Brick) = 3.95 + BaseRate
FLOOR COVER 11 (Hardwood/Carp) = 4.67 + BaseRate
ROOF COVER 3 (Shingle) = .68 + BaseRate

The sum, å, is $11.10 (1.80+3.95+4.67+0.68). This will be added to the Base Rate of $123.26 to give a modified Base Rate of $134.36. As with the Base Rate, the value attributed to each variable, and thus each feature, is derived from analysis of the market in the process called model calibration.

Our model now looks like this:

Building RCN = [(*$123.26* + $11.10) * *2,896* * Size Adjustment
Base Rate å ABRV$_n$ Effective Area
+ å AFRV$_n$] * (MV$_0$ * MV$_2$ * … * MV$_n$)

4. Next, let us turn our attention to the second type of modification to the Base Rate - the Size Adjustment.

Building RCN = [(Base Rate + å ABRV$_n$) * Effective Area * Size Adjustment + å AFRV$_n$] * (MV$_0$ * MV$_2$ * … * MV$_n$)

The Size Adjustment modifies the Base Rate to account for the size difference between the "standard size" for the "typical" house in the model and the actual size of the sample house. The "standard" size of 1,800 SF for the "typical" house, consisting of a 2-story frame residence, is used as the basis for establishing the initial Base Rates used in CAMA. The adjustment in the Base Rate allows the proper square foot rate to be applied to a house based on its size. It is reasonable to expect that as a house becomes larger than typical, the rate per square foot would decrease and conversely, if the house were smaller than typical, the rate would be higher. This Size Adjustment variable is the component in the model that adjusts for this situation. Our sample home's Size Adjustment is 0.96864 as listed on the Cost.dat sheet. Now our Base Rate is calculated to be $130.15 ((123.26+11.10) * 0.96864).

Because the adjustment is less than 1.00, it would be proper to conclude that our sample home is larger than the typical 2-story, frame home in the District of Columbia. Had the sample home been smaller than 1,800 SF, the Size Adjustment would have been greater than 1.00. The use of size adjustments eliminates the need for the traditional cost tables based on size.

The cost model continues to grow, and now looks like this:

Building RCN = [(*$123.26* + *$11.10*) * *2,896* * *0.96864*
Base Rate å $ABRV_n$ Effective Area Size Adjustment
+ å $AFRV_n$] * (MV_0 * MV_2 * … * MV_n)

5. We are finished establishing the Base Rate for our sample home and now turn to the Additive Flat Rate Variables (AFRV). This portion of the cost model is relatively straightforward. The individual Additive Flat Rate Variables are summed and the added to the product of the previous calculations.

Building RCN = [(Base Rate + å $ABRV_n$) * Effective Area * Size Adjustment + å $AFRV_n$] * (MV_0 * MV_2 * … * MV_n)

Here is where we make allowances for individual extra features contained in the sample house. Illustration 5 shows those features that constitute Additive Flat Rate Variables in the cost model:

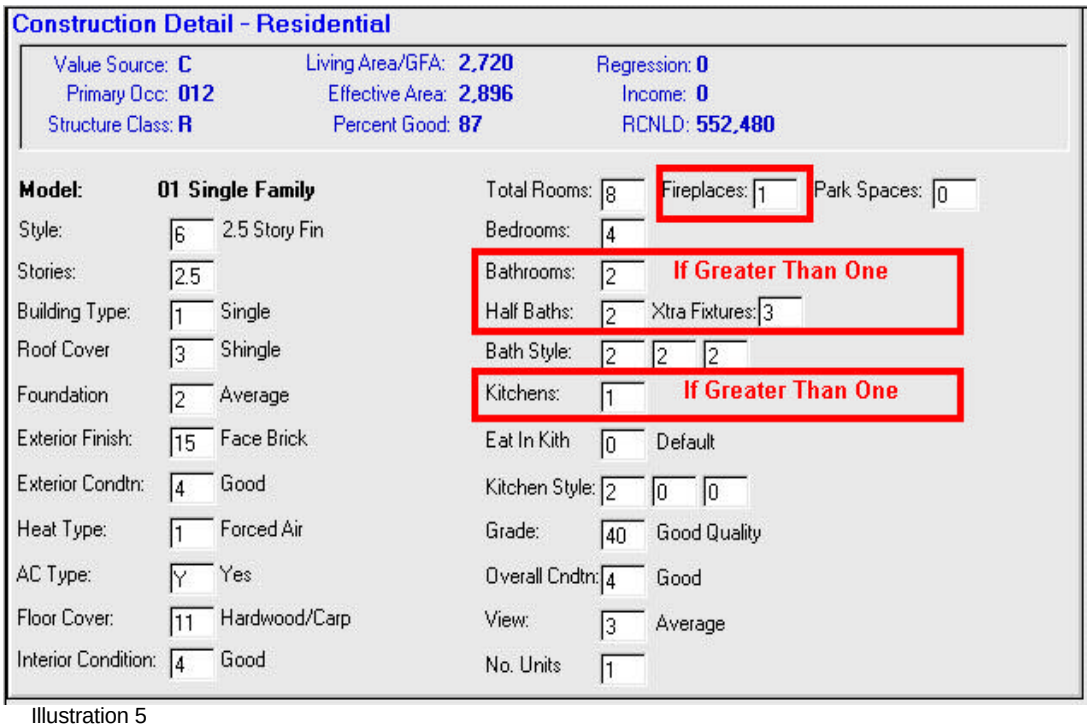

Illustration 5

Unlike the Additive Base Rate Variables (ABRV) described earlier, these features are not an integral portion of the whole house, but stand alone, so to speak. Examples include such items as fireplaces, extra bathrooms, and extra kitchens. Again, as with all other variables in the cost model, the values of these features are derived from market analysis.

Our sample home has several Additive Flat Rate Variables (AFRVs), including additional bathrooms and a fireplace. Always included in the original base rate is the cost for one full bath and one kitchen. Any bathrooms or kitchens over and above the first are accounted for as AFRVs. Illustration 5 shows our sample home also has two half baths. The AFRV for the half baths is $16,000 ($ 8,000 * 2) as shown in a portion of the Cost.dat file below.

```
**********Flat Value Additions**********
        FULL BATHS OVER 1 = 12000 + RCN
        HALF BATHS = 16000 + RCN
        FIREPLACES = 4500 + RCN
```

The sum, å, is $32,500 (12,000+16,000+4500) that will be added to the product of the previous portions of the cost formula.

The cost model is almost finished for our sample home, and now looks like this:

Building RCN = [(*$123.26* + *$11.10*) * *2,896* * *0.96864*
Base Rate å ABRV$_n$ Effective Area Size Adjustment
+ *$32,500*] * (MV$_0$ * MV$_2$ * … * MV$_n$)
å AFRV$_n$

6. The last portion of the cost model used to calculate the RCN are the multiplicative variables (MV).

Building RCN = [(Base Rate + å $ABRV_n$) * Effective Area * Size Adjustment + å $AFRV_n$] * (MV_0 * MV_2 * … * MV_n)

This portion of the formula can have the largest influence on the cost model. Each multiplicative variable modifies *all* of the cost data that has preceded it. These variables modify the Base Rate, the sum of all the increases to the Base Rate ($\sum ABRV_n$), the Size Adjustment, and the sum of all the Flat Rate Variables ($\sum AFRV_n$). This is where such important characteristics as the building grade, building condition, remodeling, Neighborhood and Sub Neighborhood factors have their impact.

The sample home is graded “Good Quality - 4”, and consequently has a 1.05 multiplicative variable. This one variable, grade, is going to increase the RCN value of the sample home by 5%. Grade can have a sizable impact on the final value of the building. For example, a "Very Good Quality - 8" increases the final rate by 42% over that of an "Average Quality - 3" house.

The condition of the building is accounted for by the multiplicative variables. The interior, exterior and overall condition of our sample home building is "Good" and the corresponding multiplicative variable is 4.2%. The coefficients for condition are the same for each category and range from -9.2% for "Poor" condition to 9.2% for "Excellent" condition. Illustration "6" shows a portion of the features that constitute the multiplicative variables in the cost model:

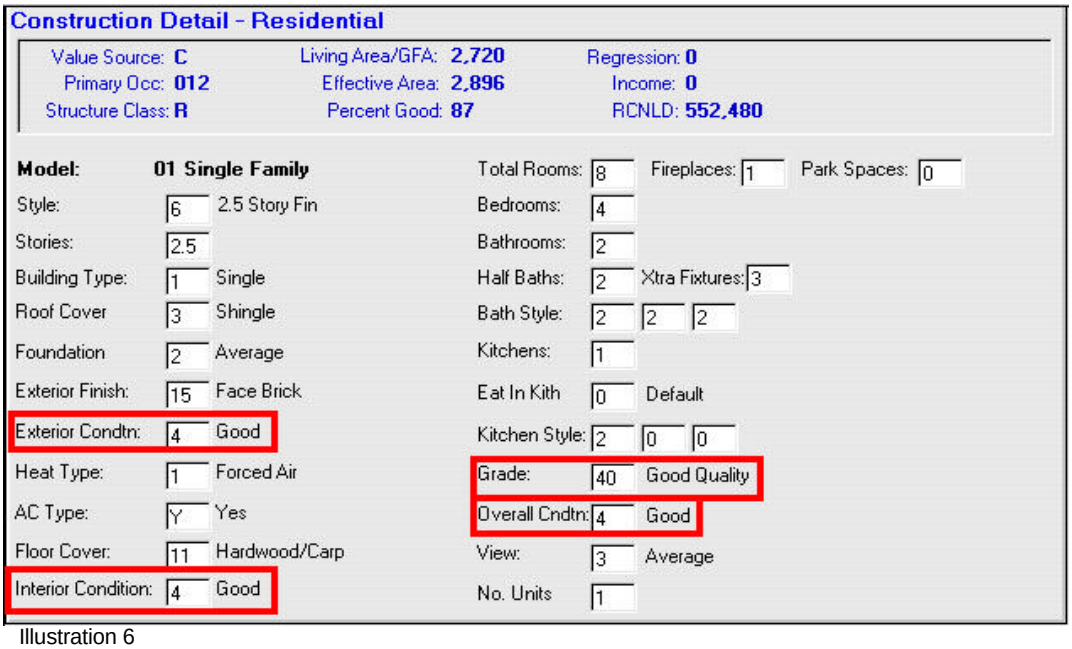

Illustration 6

Another important multiplicative variable, Remodel Type, takes into account whether or not the house has been remodeled and to what extent. In addition,

the age of the remodel factors into the amount of adjustment provided by this multiplicative variable.

Our sample home was remodeled in 2001. The portion of the CAMA record that captures this information is shown in Illustration 7 below.

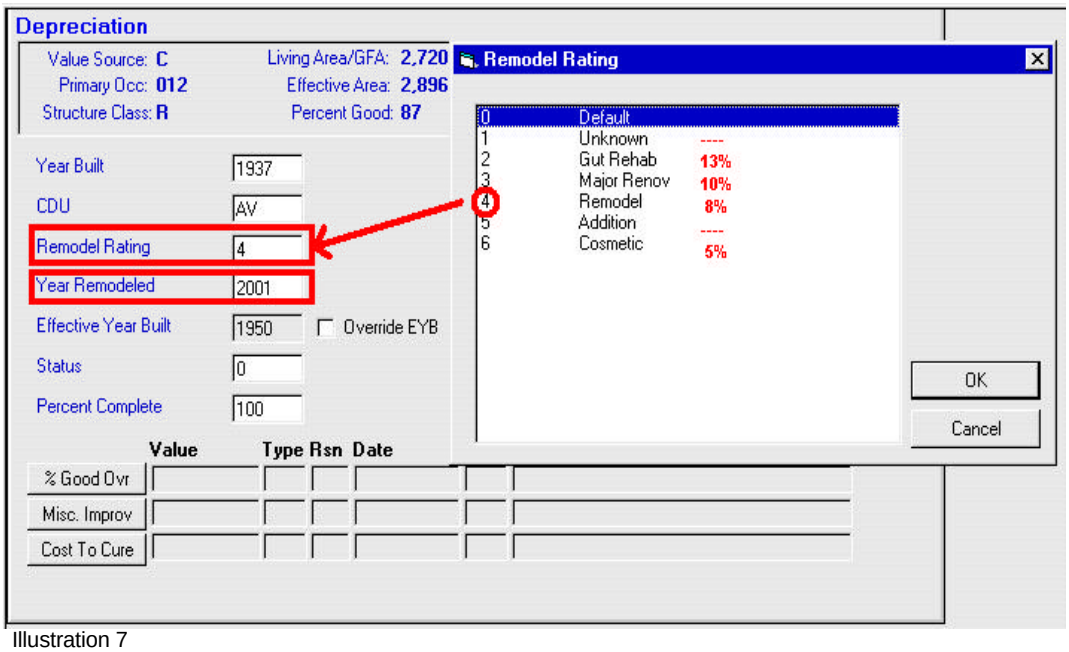

Illustration 7

Obviously, a "Gut Rehab" would increase the value of property more so than just some "Cosmetic" changes and the coefficients listed in the above illustration demonstrate this. Our sample home was remodeled in 2001, indicating that the MV should be eight percent. Eight percent would be the correct amount if the remodel occurred in 2003, but it actually occurred in 2001, two years earlier. The CAMA model takes into consideration how long ago a remodel occurred and reduces the impact, as it becomes older. The rate of reduction of the MV is five percent per year. After twenty years, a remodel has no affect on value. In this example, our sample home's remodel occurred two years ago and thus the MV is reduced by ten percent to 7.2% (8%*.90).

The last multiplicative variable, “Sub-Neighborhood Adj A”, is the local neighborhood multiplier established for the particular neighborhood where the sample home is located. This variable is going to increase the RCN value of the sample home by 21.8%. The “Sub-Neighborhood Adj” reflects the market-derived fact that location is a very significant factor in the value of real estate. Two otherwise identical homes can have a substantial difference in value based on their locations.

The variables for our sample home are summarized in the Cost.dat file as follows:

**********Factor Adjustments**********
OVERALL CONDITION 4 (GOOD) = 1.042 x RCN
EXTERIOR CONDITION 4 (GOOG) = 1.042 x RCN
GRADE 40 (Good Quality) = 1.05 x RCN
INTERIOR CONDITION 4 (GOOD) = 1.042 x RCN
REMODEL FACTOR 4 = 1.072 x RCN
SUB-NEIGHBORHOOD ADJ A = 1.218 x RCN

Each MV is multiplied together to determine the combined, or overall, MV. The sample home's MV is 1.5510811844191 (1.042*1.042*1.05*1.042*1.072*1.218).

7. Finally, the Building RCN model is complete and contains the specific data for the sample home used in this demonstration. The market-derived cost model for the sample home is as follow:

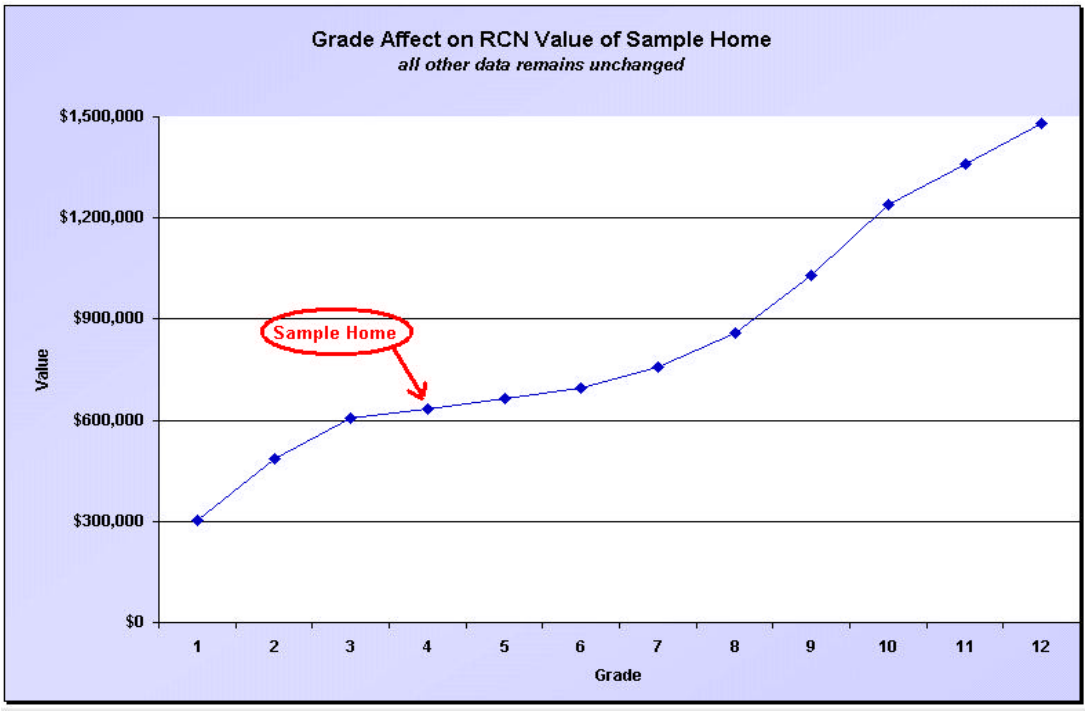
Building RCN = [(Base Rate + å ABRV$_n$) * Effective Area * Size
$ 635,035 = [($123.26 + $11.10) * 2,896 * .96864
Adjustment + å AFRV$_n$] * (MV$_0$ * MV$_2$ * … * MV$_n$)
+ $32,500] * (1.55108118441911)

The Cost.dat file shows a summary of the same information.

**********Building #1 Calc Start**********
Cost Calculation for pid, bid = 182803,173587
Account Number = 9999 9999
Use Code = 012
Cost Rate Group = R12
Model ID: R05

Section #
Base Rate: 123.26
Size Adjustment: .96864
Effective Area: 2896
Adjusted Base Rate = (123.26 + 11.1) * .96864
Adjusted Base Rate: 130.50
RCN = ((130.15 * 2896) + 32500) * 1.55108118441911
RCN: 635035

Let's take a moment to show the impact that grade selection has on RCN. Observe the chart below:



The chart illustrates the affect that different grades have on the value of residential property, all other factors remaining equal. For instance, our sample home is a Grade 4 - Good and its RCN is $ 635,035. Had the home been Grade 7 - Very Good, the RCN would be $ 755,994 almost twenty percent higher than the Grade 4 – Good home. The influence of grade on value is derived through the analysis of market sales data.

Back to our sample home. The replacement cost new for our sample home is $635,035. There is still one thing left to address before we turn our attention to depreciation. Recall that the sample home had a small open porch across the front. This item was not costed as a component of the sample home, but rather as a Special Building Feature, with its own unit price of $ 22.43 SF. Also, note that the depreciation applied to the Special Building Features is identical to the amount applied to the main building. See illustration 6 below.

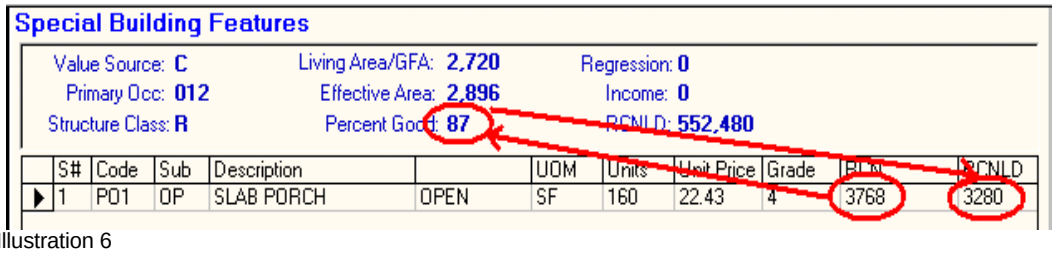


Illustration 6

We now know the total replacement cost new (RCN) of our sample home, including the porch, is $ 638,803 ($635,035 + $3,768).

If the sample home were brand new, we'd be finished, but it was actually built in 1937.

Next, we need to address accrued depreciation . . .

Depreciation

Depreciation is defined as a loss in the upper limits of value from all sources. Typically, three types of depreciation can affect real estate - physical deterioration, functional obsolescence and economic obsolescence. This next portion of the demonstration will illustrate how Vision© calculates the amount of depreciation accrued to our sample home.

Several terms come into use when discussing depreciation in CAMA. They are defined as follows:

- Actual Age: The mathematical difference between the Base Year and the actual year the improvement was built to completion.
- Actual Year Built (AYB): The earliest time the main portion of the building was built. It is not affected by subsequent construction.
- Base Year: The year, usually the current year, that the depreciation table is calibrated, such that the age of a building built during the base year would be 0 years old.
- Depreciation Table: A market-driven table that lists the amount of depreciation corresponding to an Effective Year Built and the Base Year predicated upon a specific economic life.
- Effective Age: The mathematical difference, in years, between the Base Year and the Effective Year Built.
- Effective Year Built (EYB): The calculated or apparent year, that an improvement was built that is most often more recent than AYB. The EYB is determined by the condition and quality of the improvement. Subsequent renovation, additions, upgrades and the like, extend an improvements remaining economic life and therefore cause the EYB to be closer to the Base Year than the AYB.
- Percent Good: The mathematical difference between 100 percent and the percent of depreciation. (100% - depreciation %) = percent good

The RCN model used above indicated that our sample home has an RNC of $638,803. As stated earlier, the home was built in 1937 so there should be some depreciation to deduct from the RCN. We'll uses a five-step process to depreciate improvements:

1. Calculate the Actual Age of the improvement
2. Determine the Effective Age of the improvement
3. Determine the improvement's Effective Year Built
4. Look-up Percent Good corresponding to EYB on depreciation table
5. Apply selected depreciation to RCN to determine RCNLD

1. Our first step is to calculate the Actual Age of our sample home. As you are aware, a valuation is always qualified as of a specific date. For ad valorem purposes in the District of Columbia, the valuation date is January 1 immediately proceeding the tax year. In our example, the tax year is 2005, therefore the valuation date is January 1, 2004. This date is also significant in terms of the depreciation accrued to improvements. In the past, the nature of triennial assessments required that base years within a Tri-Group remain unchanged for a period of three years. Now, however, with the return to annual assessments, the base year coincides with the valuation date. The Base Year is used to determine the Actual Age of the sample home. In this case, the sample home's Actual Age is 67 years (2004-1937).

2. The next step is to determine the sample home's Effective Age. Effective Age may or may not represent actual or chronological age. The premise is simple but the application can be confusing. If a home is built and never maintained (painting, re-roof, etc.) or remodeled, the home would quickly depreciate from physical deterioration. The CAMA system would depreciate the home at the fastest rate possible based on the selected Depreciation Table. For example, CAMA uses a 75-year Economic Life Depreciation Table for residential property. If the home were left to rot, the Effective Age would most likely be the same as the Actual Age.

Let's say the owners of our sample home have completely neglected their property from the time it was built in 1937 to the present. Their home would have an effective age of 67 years as indicated on the Depreciation Table below:

Depreciation Table

Base Year 2004

Effective Age of Building	*% Depr.*	*% Good*	*Effective Year Built*
0	0	100	2004
1	1	99	2003
2	2	98	2002
61	14	86	1943
62	14	86	1942
63	14	86	1941
64	14	86	1940
65	14	86	1939
70	15	85	1934
75	16	84	1929

Illustration 1

The Actual Year Built (1937) and the Effective Year Built (1937) would be the same and consequently the Effective Age is 65 years. Moving across the table, we see that a home with an EYB of 1937 has 14 percent depreciation and

therefore is 86 Percent Good (100%-14%). If the RCN of our sample home is $ 638,803, the depreciated value, RCNLD, is only $ 549,371 (638,803* 0.86).

Note: The depreciation table moves in 5-year periods towards its end; this explains the apparent inconsistencies in 65 years v. 67 years. The Cost.dat file represents the actual numbers used in calculations.

The situation described above rarely, if ever, occurs in the market. People do maintain and renovate their homes and in doing so, extend the home's useful or remaining economic life. As homeowners repair roofs, paint siding, replace windows and furnaces, they *prolong* the life of the home and consequently *decrease* its Effective Age.

Along with the actual age of the sample home, the illustration below shows which variables within CAMA affect the calculation of effective year built.

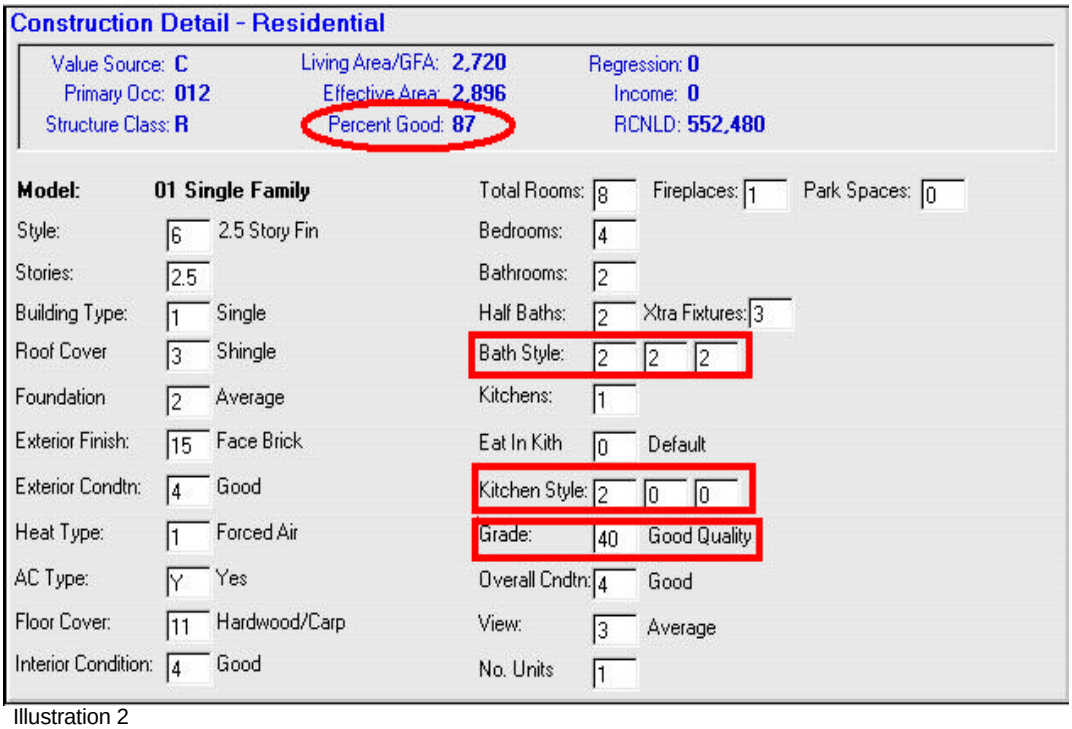

Illustration 2

All of the features or variables dealing with depreciation, highlighted in Illustration 2 are multiplicative variables. As such, they are multiplied one by the other and then the Actual Age is multiplied by the product of the MVs. Below is the portion of the Cost.dat file that summaries these MV for our sample home.

```
**************Effective Age Adjustments***************
      BATH STYLE 2 (Semi-Modern) = .95 * Age
      EFF AGE GRADE 40 (Good Quality) = .95 * Age
      KITCHEN STYLE 2 (Semi-Modern) = .9 * Age
```

The product of each of these MV adjustments is calculated to be 0.81225 (0.95 * * 0.95 * 0.9). This product is then multiplied by the Actual Age to calculate the Effective Age. Recall our sample home's Actual Age is 67 years. The Effective Age is calculated to be 54 years (67 * 0.81225). Instead of CAMA using 67 chronological years to calculated depreciation, it will use 54 years. Below is a portion of the Cost.dat file that shows these calculations.

```
*****************************************************
      Actual Year Built:  1937
      Effective Age = 67 * .81225
      Effective Age:  54
      Percent Good = 87
      RCNLD: 552480
```

3. We're almost finished. Knowing the Effective Age makes the calculation of the Effective Year Built for our sample home very simple. The Effective Year Built is 1950 (2004 – 54).

4. Having established the Effective Year Built, we look up 1950 on the *75 Year Economic Life Depreciation Table* and find that the Percent Good is 87% for that year. See Illustration 3 below.

Depreciation Table

Base Year 2004

Effective Age of Building	*% Depr.*	*% Good*	*Effective Year Built*
0	0	100	2004
1	1	99	2003
2	2	98	2002
3	2	98	2001
4	3	97	2000
51	12	88	1953
52	12	88	1952
53	12	88	1951
54	13	87	1950
55	13	87	1949
56	13	87	1948

Illustration 3

5. The last step in the process is to simply multiple the RCN by 0.87 and we have RCN LD. The depreciated, market-derived cost approach value of the sample home used in this demonstration is $ 552,480.

Some closing comments regarding depreciation are in order. Recall from the outset that we defined depreciation as a loss in value resulting from physical deterioration, functional and/or economic obsolescence. The demonstration above dealt only with depreciation attributed to the physical deterioration of the sample home. This, by far, is the most common type of depreciation that exists in residential property. However, occasions may require additional depreciation because of excessive physical deterioration, functional and/or economic obsolescence. One must use caution when invoking these types of depreciation. The market must support any decision regarding the extent of these adjustments. Below illustrates our sample home with an additional ten percent economic obsolescence. A gas station was built across the street from the home, and a recent sale of the next-door neighbor's house showed the impact of this situation.

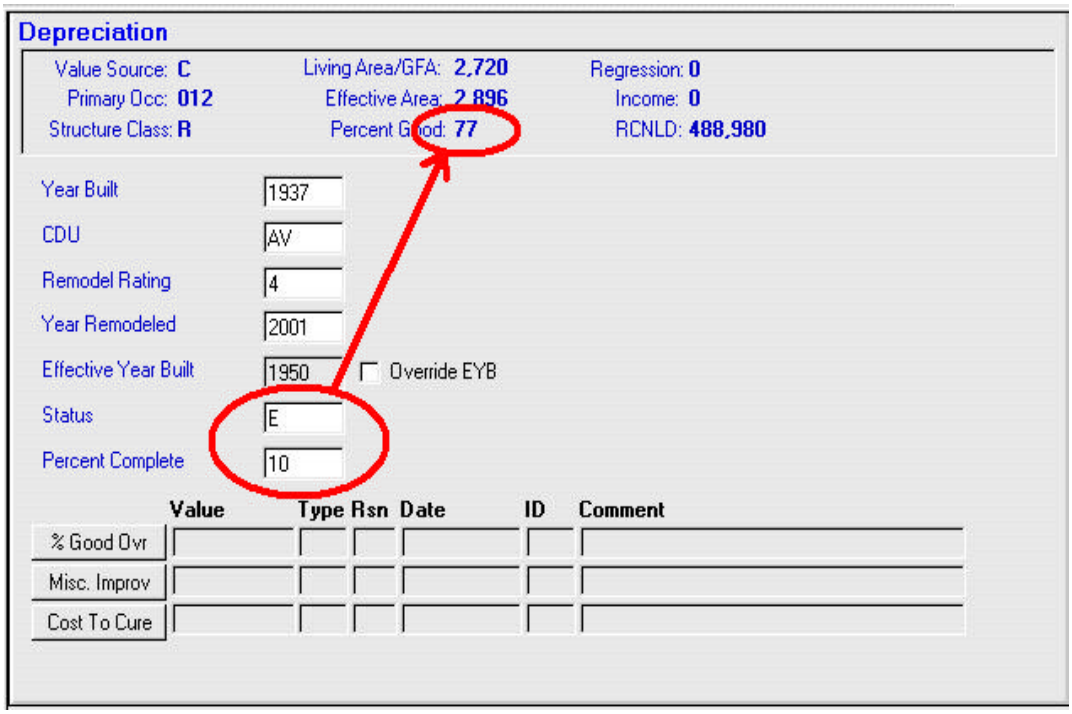

Illustration 4

The actual mechanics of adjusting depreciation for functional or economic obsolescence within CAMA are briefly discussed below. If the situation occurs, seek guidance from your supervisor and/or CAMA manager.

Illustration 5 shows the portion of the CAMA screen used to allow for additional depreciation. It is not necessary to make adjustments in the "CDU" field or to override the EYB field. Nor is it necessary to enter information on the lower 1/3 of the screen. The "Status" and "Percent Complete" fields are the only two fields that are utilized to account for additional depreciation.

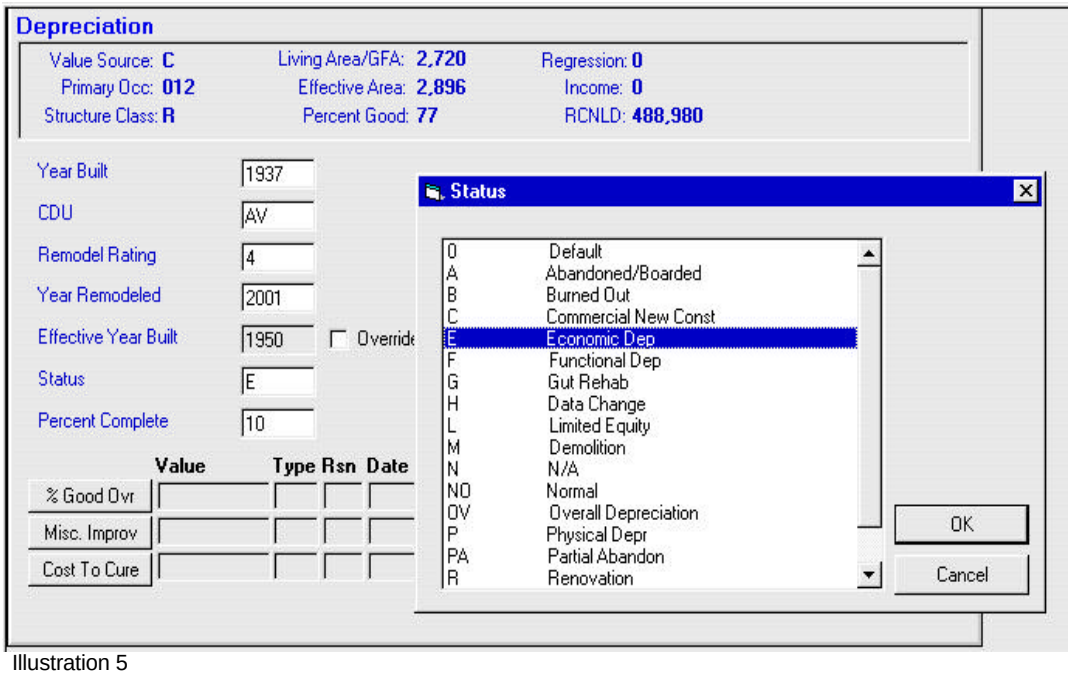

Illustration 5

The “Status” field’s pick-list is expanded in Illustration 6 to show only those types of items that have a direct affect on depreciation and the nature of the affect. Notice that only a limited number of Status Codes are functional within CAMA and their affect on depreciation is either to ***replace*** the existing amount in the “% Good” field or ***decrease*** the “% Good.” The corresponding numeric amount that will affect the “% Good” is entered in the field called “Percent Complete.” Please note that the field name “Percent Complete” is somewhat erroneous because the word “Complete” has no meaning in this context. This is the field that you will enter the amount to either decrease the existing “% Good” or replace the existing “% Good”, based on the Status Code selected.

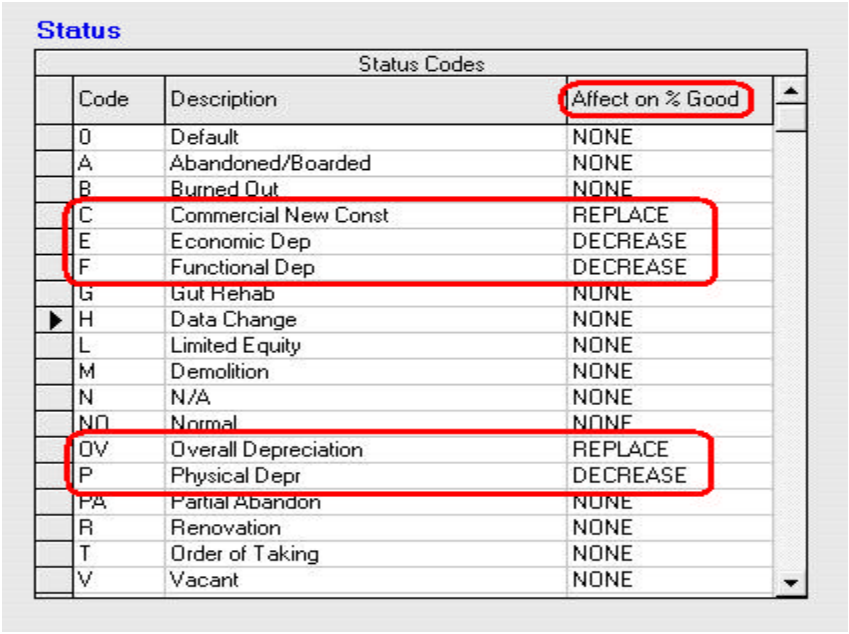

Illustration 6

Recall our example of the gas station. The Percent Complete field has “10” as it’s value. Based on the “E” Status Code, we know that the original depreciation will increase by ten percent resulting in a decrease in Percent Good to 77% (87-10).

Another comment regarding depreciation concerns the impact that the quality of design, material and workmanship have on depreciation. The grade assigned to a home obviously makes a considerable difference in the final RCN, but it also plays a substantial part in determining the amount of depreciation accrued to the home. It is easy to understand that if all other things were equal, a home built with better material and workmanship would age better than one with poorer materials and workmanship. The higher quality the home the more slowly it will deteriorate. Conversely, a shoddily built home will age more quickly than the average home.

2005 Vision Commercial CAMA Valuation Process

The market-derived cost approach to the valuation of real estate follows the generic formula of **Market Value = ((RCN LD) + land value)**, where **RCN** is Replacement Cost New of the improvements and **LD** means Less Depreciation. When properly developed and calibrated, this approach is a reliable indicator of market value especially suited to mass-appraisal CAMA systems.

The following exercise will attempt to illustrate how the Vision© CAMA system utilized by the District of Columbia, calculates values using the above model. The first portion will illustrate the development of the Replacement Cost New of a small commercial building, and the last portion will show the steps involved in determining the amount of depreciation that has accrued to the building. Land valuation is not discussed in this exercise.

Replacement Cost New

The Vision© CAMA system arrives at a RCN value for commercial properties based on a market-calibrated hybrid cost model. The hybrid nature of the model simply means that the model employs both additive and multiplicative variables in its design and specification. The nature of the model will become clearer as we proceed through this exercise. Please also be aware that a model is dynamic in both its specifications and calibration. The specifications, those cost elements that comprise the model, may change from time to time based upon research and market conditions. As you may discover, the dollar rates, or calibrations, contained here most likely are different from the current model in use. The model used in this exercise is as follows:

$$\text{Building RCN} = [\text{Section}_1\ (\text{Base Rate} * \text{Effective Area} * \text{Size Adjustment}) * (MV_1 * MV_2 * \ldots * MV_n)] + [\text{Section}_n\ (\text{Base Rate} * \text{Effective Area} * \text{Size Adjustment}) * (MV_1 * MV_2 * \ldots * MV_n)] + [?\text{Special Building Features}]$$

Where:
RCN = Replacement Cost New
Base Rate = $ rate based on occupancy (use) code and construction class
Section_n = Each separate building or section of building
Effective Area = Adjusted SF area of improvement
Size Adjustment = Adjustment factor for deviation from base size
MV = Multiplicative Variables

Several items will be helpful while examining the features of the cost model and they are collected as Appendix “A” of this document. You will need to refer to them often during this exercise. They include the following:

- Sample building’s Property Record Card (PRC)
- Cost.dat printout of the sample building
- Depreciation Schedule
- 2005 CAMA Construction Valuation Guideline – Commercial

The commercial building designed for this exercise is typical of a small commercial property in the District. It consists of a one-story full service restaurant and an adjoining two-story building. The two-story section consists of a package goods store and a small apartment on the second floor. The building is of good quality and is constructed of brick veneer over concrete block. For this exercise, the building has been logically sectioned into two sections. Section 1 covers the restaurant and Section 2 covers the package goods/apartment portion.

Below shows the Construction Detail in the CAMA record of the building. The first illustration depicts Section 1 – the restaurant and the second represents Section 2 – the package goods store and apartment.

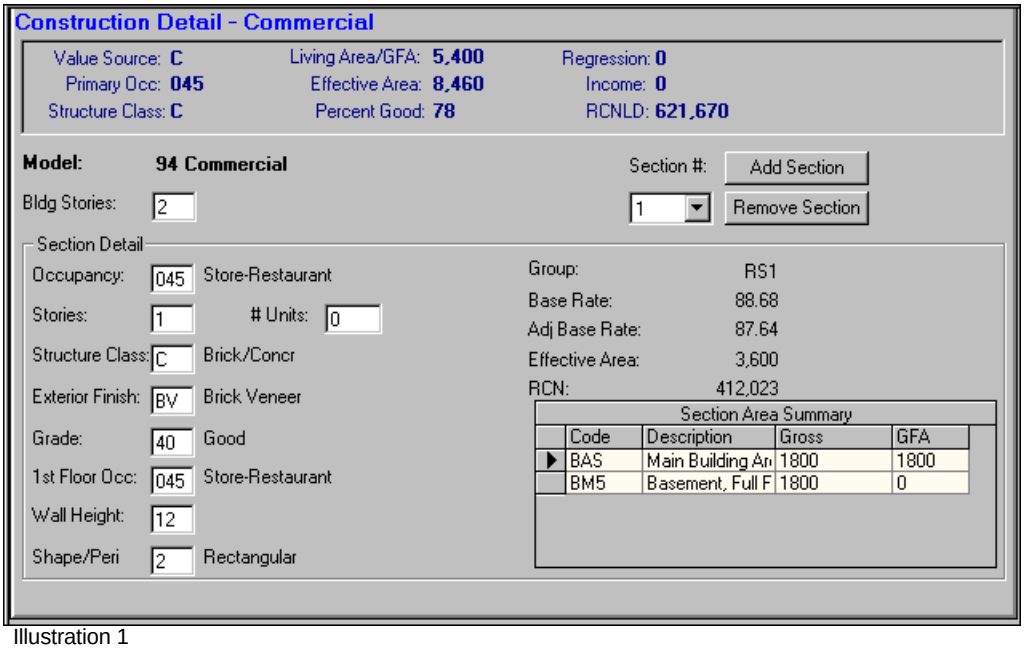

Illustration 1

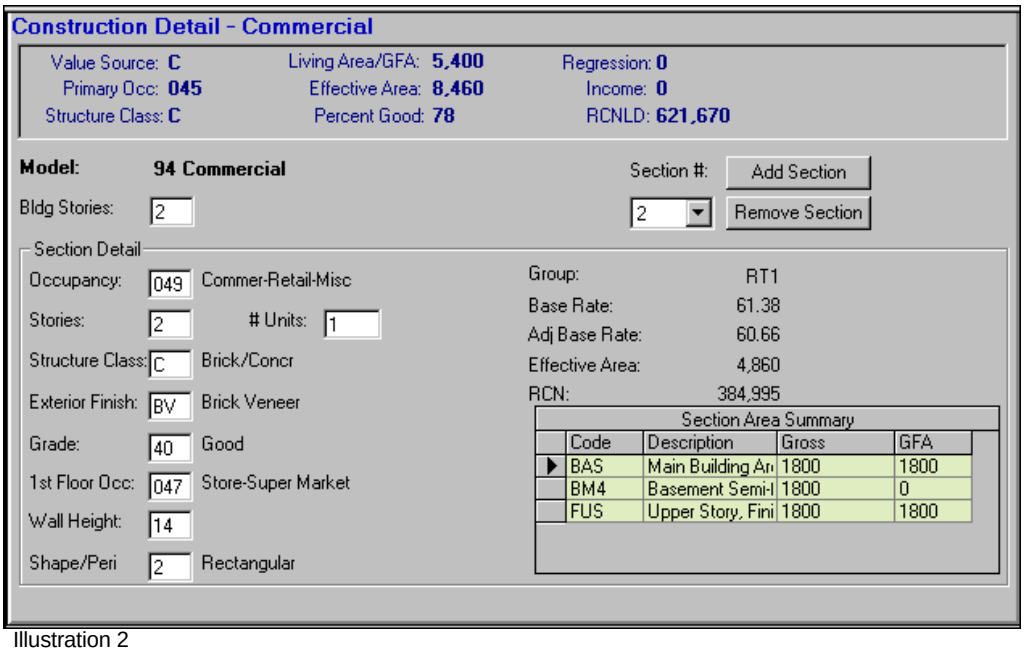

Illustration 2

Illustration 3 shows the CAMA sketch of the sample building we'll be using throughout this exercise.

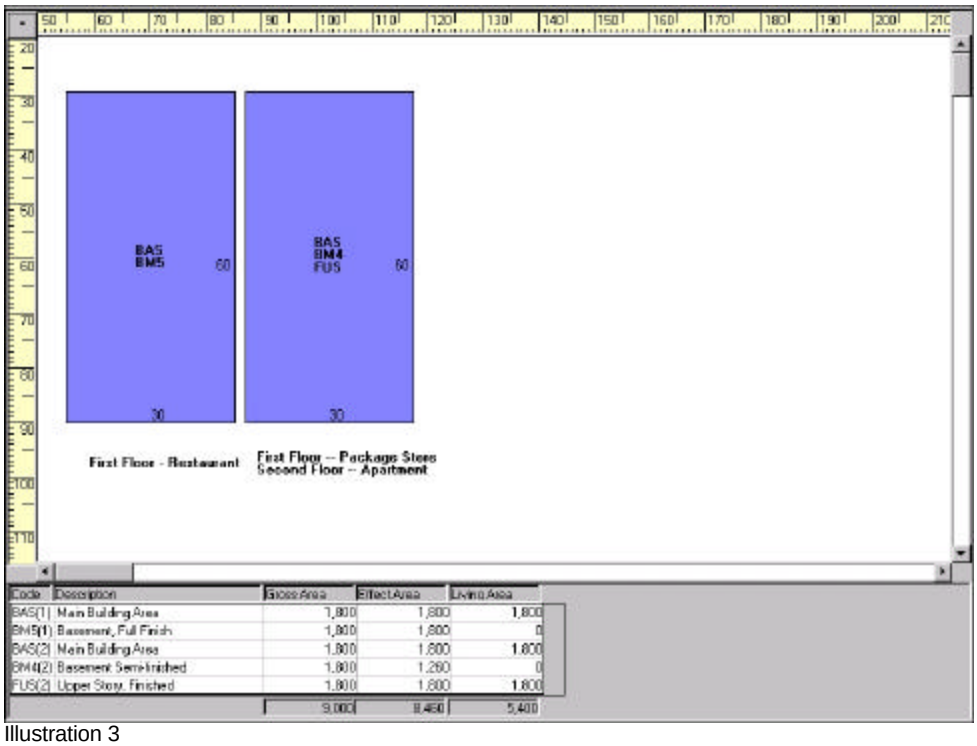

Illustration 3

The bottom of the sketch screen in CAMA provides the information about the sizes of the different areas that comprise the two sections of the building. Each section is denoted as (1) or (2) under the Code column.

Code	Description	Gross Area	Effect.Area	Living Area
BAS(1)	Main Building Area	1,800	1,800	1,800
BM5(1)	Basement, Full Finish	1,800	1,800	0
BAS(2)	Main Building Area	1,800	1,800	1,800
BM4(2)	Basement Semi-finished	1,800	1,260	0
FUS(2)	Upper Story, Finished	1,800	1,800	1,800
		9,000	8,460	5,400

Illustration 4

1. First, let's illustrate the calculation of the Effective Area of our sample building's first section, the restaurant.

Building RCN = [Section$_1$ (Base Rate * Effective Area * Size Adjustment) * (MV_0 * MV_2 * … * MV_n)] + [Section$_n$ (Base Rate * Effective Area * Size Adjustment) * (MV_0 * MV_2 * … * MV_n)] + [?Special Building Features]

Code	Description	Gross Area	Effect.Area	Living Area
BAS(1)	Main Building Area	1,800	1,800	1,800
BM5(1)	Basement, Full Finish	1,800	1,800	0
BAS(2)	Main Building Area	1,800	1,800	1,800
BM4(2)	Basement Semi-finished	1,800	1,260	0
FUS(2)	Upper Story, Finished	1,800	1,800	1,800
		9,000	8,460	5,400

Illustration 5

The Effective Area is comprised of the totals of the Bas(1) Main Building Area @ 1,800 SF and the BM5(1) Basement, Full Finish @ 1,800 SF for a total of 3,600 SF.

The second section's Effective Area is calculated in the same manner.

Code	Description	Gross Area	Effect.Area	Living Area
BAS(1)	Main Building Area	1,800	1,800	1,800
BM5(1)	Basement, Full Finish	1,800	1,800	0
BAS(2)	Main Building Area	1,800	1,800	1,800
BM4(2)	Basement Semi-finished	1,800	1,260	0
FUS(2)	Upper Story, Finished	1,800	1,800	1,800
		9,000	8,460	5,400

Illustration 6

BAS(2) Main Building Area, BM4 (2)Basement Semi-finished, and FUS (2) Upper Story, Finished total 4,860 SF. The adjustment to the semi-finished basement takes into account this area is not as expensive as the finished main building area. For example, if the base rate for the finished main building area is $100/SF, the rate for the semi-finished basement area may only be $70/SF. The RCN value of the basement would be calculated as follows:

RCN of Basement = $126,000 or (1800 SF * $70)

Another way to state the same situation is to adjust the size of the basement to 70% of its measured size and then multiply the resulting, *or effective*, size by the base rate of $100/SF:

RCN of Basement = $126,000 or [(1800 * .70) * $100]

Both methods arrive at the same value for the basement. The first method is more intuitive and easier to explain to taxpayers as it adjusts for the differences in costs for the various areas. The second method again provides the same results but is much easier to model and calculate within a CAMA system, thus the effective area calculations shown here represent the methodology employed in the Vision© CAMA system.

The Gross Area shown in Illustration 2 is the total unadjusted size of all the areas that are a part of the building. The Living Area is more properly called "Gross Floor Area" and is the unadjusted size of the actual finished floor area above grade in the building.

With the inclusion of the Effective Area calculation, our cost model now looks like this:

Building RCN = [Section$_1$ (Base Rate * 3600 * Size Adjustment) *
Effective Area
(MV_0 * MV_2 * … * MV_n)] +
[Section$_n$ (Base Rate * 4860 * Size Adjustment) *
Effective Area
(MV_0 * MV_2 * … * MV_n)] +
[?Special Building Features]

2. Next, let's look at the selection of the Base Rate for the sample building. There will be two rates because there are two different sections. Each section's RCN will be independently calculated.

Building RCN = [Section$_1$ (Base Rate * Effective Area * Size Adjustment) *
(MV_0 * MV_2 * … * MV_n)] +
[Section$_n$ (Base Rate * Effective Area * Size Adjustment) *
(MV_0 * MV_2 * … * MV_n)] +
[?Special Building Features]

The Base Rate is the dollar rate per square foot used in the valuation model that is derived from tables within the CAMA system. It is selected based on the building's Building Occupancy (Use) Code and Construction Class. Our sample's first section is a "45-Store-Restaurant" constructed as a Class "C", concrete block/brick building. Based on this information, the Base Rate of $ 88.68 is automatically selected.

The second section, "49-Commercial Retail-Misc.", also constructed as a Class "C", concrete block/brick building, has a Base Rate of $61.38.

With the inclusion of the selected Base Rates, our model now looks like this:

Building RCN = [Section$_1$ ($88.68 * 3600 * Size Adjustment) *
Base Rate Effective Area
(MV_0 * MV_2 * … * MV_n)] +
[Section$_n$ ($61.38 * 4860 * Size Adjustment) *
Base Rate Effective Area
(MV_0 * MV_2 * … * MV_n)] +
[?Special Building Features]

3. Next, let us turn our attention to a modification to the Base Rate - the Size Adjustment.

Building RCN = [Section$_1$ (Base Rate * Effective Area * Size Adjustment) * (MV_0 * MV_2 * … * MV_n)] + [Section$_n$ (Base Rate * Effective Area * Size Adjustment) * (MV_0 * MV_2 * … * MV_n)] + [?Special Building Features]

The Size Adjustment modifies the Base Rate to account for the size difference between the "standard size" for the "typical" building of a particular occupancy type and the actual size of the sample building. The comparison is based on the building's "gross floor area." The "standard" size of 5,000 square feet for the "typical" restaurant is used as the basis for establishing the initial Base Rates used in Section 1 of this appraisal. The "standard" size of 4,000 square feet for the "typical" retail-misc. is used as the basis for establishing the initial Base Rates used in Section 2.

The adjustment in the Base Rate allows the proper square foot rate to be applied to a building based on its size. It is reasonable to expect that as a building becomes larger than typical, the rate per square foot would decrease and conversely, if the building were smaller than typical, the rate would be higher. The Size Adjustment variable is the component in the model that adjusts for this situation. Our sample building's size, the "gross floor area," is the total area of both sections, 5,400 square feet. Our building is only slightly larger than the standard size of 5,000 square feet. The Size Adjustment is 0.98825. Now our Adjusted Base Rate is calculated to be \$87.64(88.68 * 0.98825) for Section 1 and \$ 60.66 (61.38 * 0.98825) for Section 2 of our example.

Because the adjustment is less than 1.00, it would be proper to conclude that our sample building is larger than the typical building of its type in the District of Columbia. Our sample building was compared to the larger of the two "standard" sizes, 5,000 square feet. Had the sample building been smaller than 5,000 square feet, the Size Adjustment would have been greater than 1.00. The use of size adjustments eliminates the need for the traditional cost tables based on size.

The cost model continues to grow, and now looks like this:

Building RCN = [Section$_1$ (\$88.68 * 3600 * 0.98825) * (MV_0 * MV_2 * … * MV_n)] + [Section$_n$ (\$61.38 * 4860 * 0.98825) * (MV_0 * MV_2 * … * MV_n)] + [?Special Building Features]

Base Rate Effective Area Size Adjustment

Base Rate Effective Area Size Adjustment

4. The next portion of the cost model used to calculate the RCN are the multiplicative variables (MV).

Building RCN = [Section$_1$ (Base Rate * Effective Area * Size Adjustment) * (MV_0 * MV_2 * … * MV_n)] +
[Section$_n$ (Base Rate * Effective Area * Size Adjustment) * (MV_0 * MV_2 * … * MV_n)] +
[?Special Building Features]

This portion of the formula can have the largest influence on the cost model. Each multiplicative variable modifies *all* of the cost data that has preceded it. These variables modify the Base Rate and Size Adjustment. This is where such important characteristics as the building grade, local cost multipliers, Neighborhood and Sub Neighborhood factors have their impact.

The sample building is graded "Good Quality - 4", and consequently has a 1.12 multiplicative variable. This one variable, grade, is going to increase the RCN value of the sample building by 12%. It can not be stated often enough, grading, along with proper effective area, are extremely significant in terms of accurate appraisals. Another MV, "DC Local Multiplier C" modifies costs to account for the small additional costs incurred in construction of "C" class buildings in the in the DC area. The other multiplicative variable, "COMM NBHD 9", is the local neighborhood multiplier established for the particular neighborhood where the sample building is located. This variable is going to increase the RCN value of the sample building by 10%. The "COMM NBHD" adjustment reflects the market-derived fact that location is a very significant factor in the value of real estate. Two otherwise identical buildings can have a substantial difference in value based on their locations.

These three variables are summarized in the Cost.dat file as follows:

****************Factor Adjustments************************
GRADE 40 (Good) = 1.12 x RCN
DC LOCAL MULTIPLIER C = 1.06 x RCN
COMM NBHD 9 = 1.1 x RCN

Each MV is multiplied together to determine the combined, or overall, MV. The sample building's MV is 1.30592 (1.12 * 1.06 * 1.1).

5. Except for the Special Building Features, our RCN model is complete and contains the specific data for the sample building used in this demonstration. The RCN cost model for the sample building is as follow:

Building RCN = [Section$_1$ ($88.68 * 3600 * 0.98825) *
Base Rate Effective Area Size Adjustment
(1.30592)] +
Multiplicative Variables
[Section$_n$ ($61.38 * 4860 * 0.98825) *
Base Rate Effective Area Size Adjustment
(1.30592)] +
Multiplicative Variables
[?Special Building Features]

The RCN for Section 1, the restaurant is $ 412,023 ($88.68 * 3600 * 0.98825 * 1.30592). The package goods store's RCN is $384,995 ($61.38 * 4860 * 0.98825 * 1.30592).

The Cost.dat file shows a summary of the same information as follows:

Section #1
Base Rate: 88.68
Size Adjustment: .98825
Effective Area: 3600
Adjusted Base Rate = (88.68 + 0) * .98825
Adjusted Base Rate: 87.64
RCN = ((87.64 * 3600) + 0) * 1.30592
RCN: 412023
Section #2
Base Rate: 61.38
Size Adjustment: .98825
Effective Area: 4860
Adjusted Base Rate = (61.38 + 0) * .98825
Adjusted Base Rate: 60.66
RCN = ((60.66 * 4860) + 0) * 1.30592
RCN: 384995

So far, the RCN of the building is $ 797,018 (412,023+384,995). We still have Special Features to add to complete the cost model.

6. The Special Features component is the last portion of the cost model. This is the place where such things as sprinklers and HVAC systems are accounted for and valued in the building.

Building RCN = [Section$_1$ (Base Rate * Effective Area * Size Adjustment) * (MV_0 * MV_2 * … * MV_n)] +
[Section$_n$ (Base Rate * Effective Area * Size Adjustment) * (MV_0 * MV_2 * … * MV_n)] +
[?Special Building Features]

Take a look at illustration 7. Here we see that both sections are sprinklered and heated and cooed with a complete HVAC system. Both of these Special Building features are calculated based on the size, in square feet, of the area affected. Their value is determined by the size, dollar rate and quality grade for each

feature. Finally, the Special Building Features are depreciated at the same rate as the main buildings.

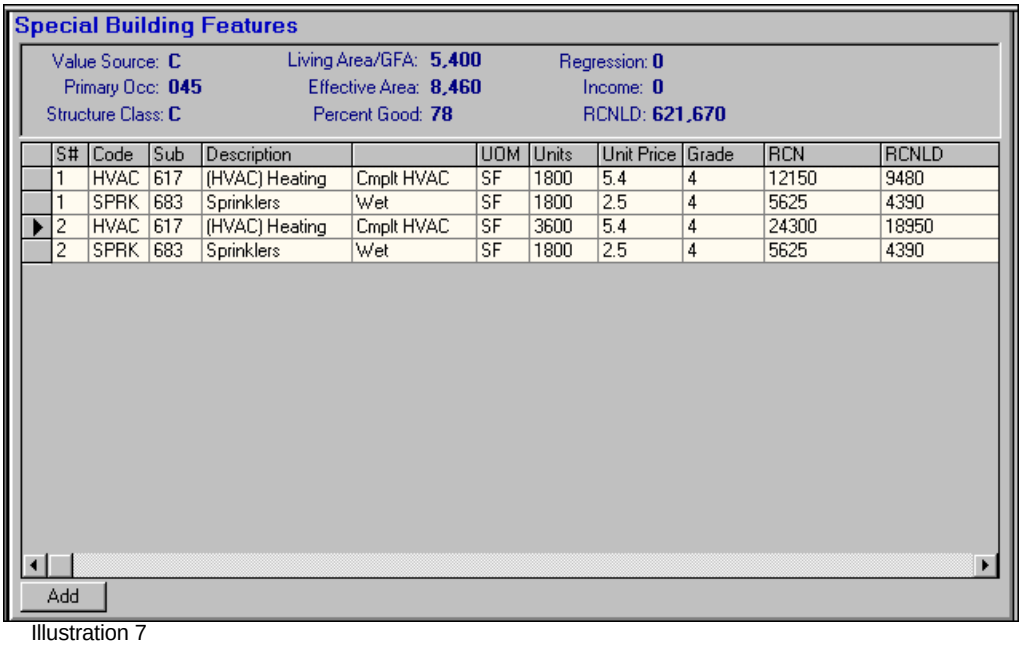

Illustration 7

Illustration 8 shows the data-entry screen, as it would look if we were to add an elevator to the building.

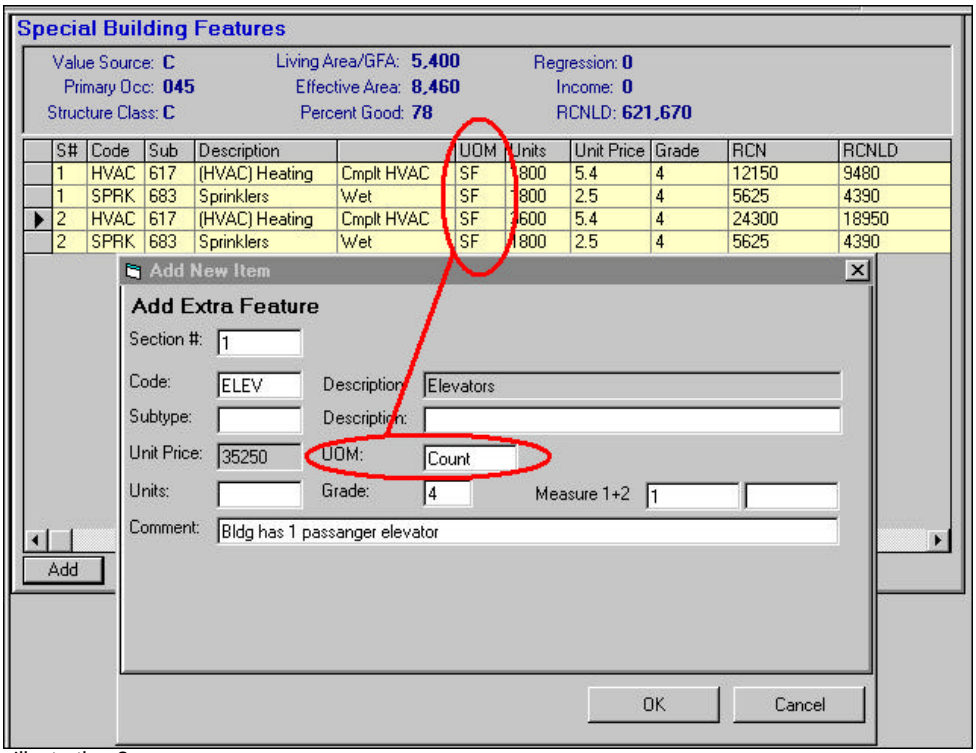

Illustration 8

Note that this extra feature's UOM (unit of measurement) is by count and not SF. For each count, the unit price is $35,250. Be sure that the UOM is proper for the individual special feature included in the building.

The total RCN of the Special Feature in this sample is $ 47,700 (?Special Building Features =12,150 + 5,625 +24,300 + 5,625).

We now know the total replacement cost new (RCN) of our sample building, including Special Features, is $ 844,718 ($797,018 + $47,700).

$844,718 **Building RCN**	**= [Section$_1$ ($88.68 * 3600 * 0.98825) * (1.30592)] +**
	[Section$_n$ ($61.38 * 4860 * 0.98825) * (1.30592)] +
	[$47,700]

Base Rate | Effective Area | Size Adjustment | Multiplicative Variables | Base Rate | Effective Area | Size Adjustment | Multiplicative Variables | [?Special Building Features]

If the sample building were brand new, we'd be finished, but it was actually built in 1953.

Next, we need to address accrued depreciation . . .

Depreciation

Depreciation is defined as a loss in the upper limits of value from all sources. Typically, three types of depreciation can affect real estate - physical deterioration, functional obsolescence and economic obsolescence. This next portion of the demonstration will illustrate how Vision© calculates the amount of depreciation accrued to our sample building.

Several terms come into use when discussing depreciation in CAMA. They are defined as follows:

- Actual Age: The mathematical difference between the Base Year and the actual year the improvement was built to completion.

- Actual Year Built (AYB): The earliest time the main portion of the building was built. It is not affected by subsequent construction.

- Base Year: The year, usually the current year, that the depreciation table is calibrated, such that the age of a building built during the base year would be 0 years old.

- Depreciation Table: A market-driven table that lists the amount of depreciation corresponding to an Effective Year Built and the Base Year predicated upon a specific economic life.

- Economic Life: The useful life span for a structure based on its occupancy (use) code and its construction class.

- Effective Age: The mathematical difference, in years, between the Base Year and the Effective Year Built.

- Effective Year Built (EYB): The calculated or apparent year, that an improvement was built that is most often more recent than AYB. The EYB is determined by the condition and quality of the improvement. Subsequent renovation, additions, upgrades and the like, extend an improvements remaining economic life and therefore cause the EYB to be closer to the Base Year than the AYB.

- Percent Good: The mathematical difference between 100 percent and the percent of depreciation. (100% - depreciation %) = percent good

The RCN model used above indicated that our sample building has an RNC of $844,718. As stated earlier, the building was built in 1953, so there should be some depreciation to deduct from the RCN. We'll use a seven-step process to depreciate the improvements:

1. Calculate the Actual Age of the improvement.
2. Determine the Effective Age of the improvement.
3. Determine the improvement's Effective Year Built.
4. Look-up Depreciation corresponding to EYB on depreciation table.
5. If required, multiply the depreciation by the variable generated by the CDU factor.
6. If required, modify the depreciation by the amount given for obsolescence.
7. Apply final depreciation to RCN to determine RCNLD.

1. Our first step is to calculate the Actual Age of our sample building. As you are aware, a valuation is always qualified as of a specific date. For ad valorem purposes in the District of Columbia, the valuation date is January 1 immediately proceeding the tax year. In our example, the tax year is 2005, therefore the valuation date is January 1, 2004. This date is also significant in terms of the depreciation accrued to improvements. In the past, the nature of triennial assessments required that base years within a Tri-Group remain unchanged for a period of three years. Now, however, with the return to annual assessments, the base year coincides with the valuation date. The base year is used to determine the Actual Age of the sample building. In this case, the sample building's Actual Age is 51 years (2004-1953).

2. The next step is to determine the sample building's Effective Age. Effective Age may or may not represent actual or chronological age. The premise is simple but the application can be confusing. If a building is built and never maintained (painting, re-roof, etc.) or remodeled, the building would quickly depreciate from physical deterioration. The CAMA system would depreciate the building at the fastest rate possible based on the selected Depreciation Table. For example, our building has an economic life of sixty years. If the building were left to rot, the Effective Age would most likely be the same as the Actual Age.

Let's say the owners of our sample building have completely neglected their property from the time it was built in 1953 to the present. Their building would have an effective age of 51 years as indicated on the Depreciation Table below:

Economic Life Depreciation Tables

Base Year 2004

		60 Year Economic Life		50 Year Econmic Life	
Age of Building	*Effective Year Built*	*Percent of Depreciation*	*Percent Good*	*Percent of Depreciation*	*Percent Good*
0	2004	0	100	0	100
1	2003	0	100	0	100
2	2002	1	99	2	98
3	2001	1	99	2	98
47	1957	56	44	75	25
48	1956	58	43	77	23
49	1955	59	41	78	22
50	1954	61	39	82	18
51	1953	64	36		
52	1952	65	35		
53	1951	68	33		
54	1950	69	31		
55	1949	71	29		
56	1948	73	28		
57	1947	75	25		

Illustration 9

The Actual Year Built (1953) and the Effective Year Built (1953) would be the same and consequently the Effective Age would be 51 years. Moving across the table, we see that a building with an EYB of 1953 has 64 percent depreciation and therefore is 36 Percent Good (100%-64%). If the RCN of our sample building is $ 844,718, the depreciated value, RCNLD, is only $ 304,098 (844,718 * 0.39).

The situation described above rarely, if ever, occurs in the market. People do maintain and renovate their buildings and in doing so, extend the building's useful or remaining economic life. As building owners repair roofs, paint siding, replace windows and furnaces, they *prolong* the life of the building and consequently *decrease* its Effective Age.

A recent building remodel, renovation or rehabilitation will go a long way to extend its useful life. As the useful life is extended, the Effective Age is reduced and therefore the Effective Year Built is more recent than the building's Actual Year Built.

Our sample building had a major renovation done in 1998. The portion of the CAMA record that captures this information is shown in Illustration 10 below.

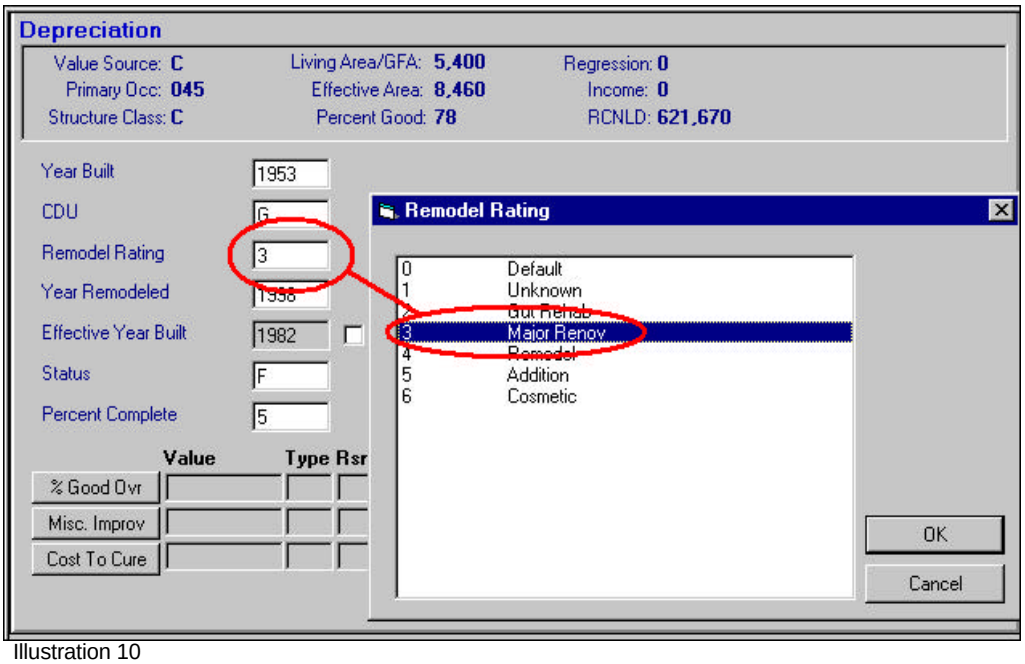

Illustration 10

Two factors come together to determine the impact a remodel has on the amount of depreciation calculated for the building – the Remodel Rating and the Year Remodeled. How extensive the remodel is and how recently it has occurred combines to determine its overall affect on its effective year built, and in turn, the building's depreciation. A brand-new gut rehab would substantially decrease the effective age of a building much more so than an older remodel. Conversely, an older remodel may have little or no affect on the depreciation.

We'll see the significance of that renovation in a moment, but first, back to our sample building's Effective Age calculation.

The construction class of the building also affects the calculation of Effective Age. It is only natural that an "A" class structure would have a longer economic life than a "D" class building (recall the story of the three little pigs). The Structure Class Age Factor makes allowance for this situation by reducing the effective age of an "A" class building by more than, say, a "D" building. As an example, CAMA reduces the effective age by 20% for "A" buildings, 15% for "B" structures, 10% on "C" buildings, and no adjustment for the "D" class buildings.

The features or variables dealing with the effective age calculation are multiplicative variables. As such, they are multiplied one by the other and then the Actual Age is multiplied by the product of the MVs. Below is the portion of the Cost.dat file that summaries these MV for our sample building.

**********Effective Age Adjustments**********
REHAB FACTOR 3 = .45 * Age
STRUCTURE CLASS AGE FACTOR C = .9 * Age
REHAB YEAR = 1.05 * Age

The product of each of these MV adjustments is calculated to be 0.42525 (0.45 * 0.90 * 1.05). This product is then multiplied by the Actual Age to calculate the Effective Age. Recall our sample building's Actual Age is 51 years. The Effective Age is calculated to be 21 years (51 * 0.42525). Instead of CAMA using 51 chronological years to calculated depreciation, it will use 21 years, based on the building's quality and renovation. The portion of the Cost.dat file that illustrates this information is below:

****

Actual Year Built: 1953
Effective Age = 51 * .42525
Effective Age: 21
Percent Good = 78
RCNLD: 621670

Back to our renovation, the 1998 gut rehab done to the building reduced the effective age to 47.25% (Rehab Factor 3 =.45 * Rehab Year = 1.05) of the 51 years of actual age, resulting in an effective age of 24 years old. What impact on the effective age would there be if just a small remodel occurred in 1990? We would expect the effective age not to shorten, or decrease, as much as a result. Let's see what happens.

As you know, CAMA has many calibrated variables associated with all of the calculations it makes to determine the RCN and calculate depreciation. Again, the two variables that come into play here are the Rehab Factor and the Rehab Year. We've just seen the values of those variables were with regard to the recent gut rehab example. For the 1990 remodel the values are: Rehab Factor 4= 0.55 and Rehab Year = 1.25. This combination will reduce the effective age to 68.75% (0.55 * 1.25) of the 51 years of actual age, as a result, making the effective age now 35 years old.

The difference between the two scenarios is eleven years. Without doing all math, the difference in the appraised value as a result an effective age of 35 years verses 24 years is about $100,000 on a building with a RCN of $844,718. The proper documentation of remodel activity is significant when arriving at proper appraised values.

3. We're almost finished. Knowing the Effective Age makes the calculation of the Effective Year Built for our sample building very simple. The Effective Year Built is 1983 (2004 – 21).

4. Having established the Effective Year Built, we look up 1983 on the *60 Year Economic Life Depreciation Table* and find that the Depreciation is 16% for that year. See Illustration 11.

Economic Life Depreciation Tables

Base Year 2004

Age of Building	Effective Year Built	60 Year Economic Life		50 Year Econmic Life	
		Percent of Depreciation	Percent Good	Percent of Depreciation	Percent Good
0	2004	0	100	0	100

18	1986	14	86	18	82
19	1985	15	85	20	80
20	1984	16	84	22	78
21	1983	16	84	22	78
22	1982	18	83	23	77
23	1981	19	81	25	75
24	1980	20	80	27	73
25	1979	21	79	28	72
26	1978	23	78	30	70
27	1977	24	76	32	68

Illustration 11

You may notice that there is a conflict between the Cost.dat file and the depreciation table with regards to "Percent Good." The Cost.dat file report that our building's percent good is 79, whereas the depreciation table says it's 84. The explanation is addressed in step 6, dealing with obsolescence and direct adjustments to depreciation, not effective year built calculations.

5. If an entry other than "AV-Average" was made to the CDU (condition, desirability, utility) factor, the current depreciation is multiplied by the CDU's corresponding variable. In the case of our sample building, the CDU was Good. The factor is 0.97 per the Cost.dat file.

**********Depreciation Adjustments**********
CDU DEPREC FACTOR G = .97 * Depreciation

This is actually a very insignificant adjustment to the calculated depreciation. The calculated depreciation from Step 4 was 16%. When multiplied by 0.97 the result is still 16% because of rounding (16 * 0.97= 15.52, say 16).

6. If the assessor notes any obsolesce, this is where it is addressed. Recall from the outset that we defined depreciation as a loss in value resulting from physical deterioration, functional and/or economic obsolescence. The demonstration up to this point has dealt only with depreciation attributed to the physical deterioration of the sample building. This, by far, is the most common type of depreciation that exists in commercial property. However, occasions may require additional depreciation because of excessive physical deterioration, functional and/or economic obsolescence. One must use caution when invoking these types of depreciation. The market must support any decision regarding the extent of these adjustments.

Our sample building is suffering from a small amount of functional obsolescence. The assessor has noted that the interior design of the building contains many

support columns interrupting the efficient use of the floor space. As a result, the restaurant has a few less tables and the package goods store does not have a good aisle layout. Consequently, it is appropriate to allow for a small amount of functional obsolescence – five percent.

Illustration 12 shows the results of this additional allowance for functional obsolescence. Whereas the depreciation table in illustration 3 shows the percent good for 16 years at 84%, by subtracting the 5% attributed to functional obsolescence, we are left with 79% as the percent good for our building. This matches the figure shown in the Cost.dat file.

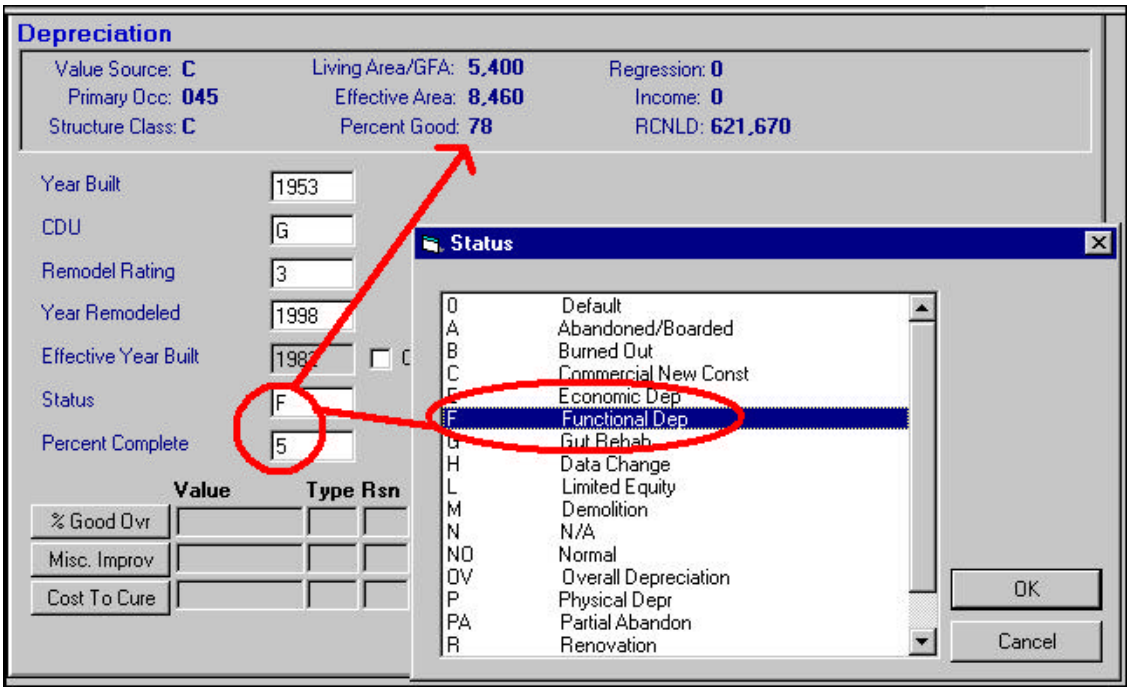

Illustration 12

The actual mechanics of adjusting depreciation for functional or economic obsolescence within CAMA are briefly discussed below. If the situation occurs, seek guidance from your supervisor and/or CAMA manager.

The "Status" field's pick-list is expanded in Illustration 13 to show only those types of items that have a direct affect on depreciation and the nature of the affect. Notice that only a limited number of Status Codes are functional within CAMA and their affect on depreciation is either to ***replace*** the existing amount in the "% Good" field or ***decrease*** the "% Good." The corresponding numeric amount that will affect the "% Good" is entered in the field called "Percent Complete." Please note that the field name "Percent Complete" is somewhat erroneous because the word "Complete" has no meaning in this context. This is the field that you will enter the amount to either decrease the existing "% Good" or replace the existing "% Good", based on the Status Code selected.

7. The last step in the process is to simply multiple the RCN by 0.78 and we have RCN LD of the building. Knowing the total RCN of our sample building is $844,718, the RCN LD is $658,880 (844,718 * 0.78). Below is a portion of the Property Record Card that illustrates this information.

Conclusion

This exercise has been prepared to assist the commercial assessor understand some of the concepts, features and techniques employed by the Vision© CAMA system in arriving at a cost approach to valuation of commercial properties in the District of Columbia. It does not serve as an exhaustive training manual. Any specific questions regarding the features and operations of this CAMA should be directed to your supervisor or the CAMA manager.

A-19		Vacant/Short Term Office Market Income	YES	Vacant/Short Term Office Area X Office Market Rate
A-20	Vacant/Short Term Lower Level	Vacant/Short Term Lower Level Office Space	NO	
A-21		Vacant/Short Term Lower Level Office Market Rental Rate	NO	
A-22	Lower Level Income	Vacant/Short Term Lower Level Office Market Income	YES	Vacant/Short Term Lower Level Office Area X Market Rental Rate
A-23	Vacant/ Short Term Space	Vacant or Expiring(Within 3 Years) Retail Leases	NO	
A-24		Additional Retail Space from Additional Revenue Worksheet	YES	Adds Total Retail from Additional Revenue Worksheet (H-4)
A-25		Total of Vacant/Short Term Retail Spaces	YES	Sum of Vacant/Short Term Retail Leases
A-26		Vacant/Short Term Retail Market Income	YES	Sum of Vacant/Short Term Retail Leases X Retail Market Rate
A-27	Vacant/Short Term Lower Level Retail	Vacant/Short Term Lower Level Retail Space	NO	
A-28		Vacant/Short Term Lower Level Retail Market Rental Rate	NO	
A-29	Lower Level Income	Vacant/Short Term Lower Level Retail Market Income	YES	Vacant /Short term Retail Area X Market Retail Rate
B-1		Office Leases Scheduled to Expire in Year 1 of Valuation	NO	
B-2		Additional Office Leases Scheduled to Expire in Year 1 of Valuation	YES	Sum of Additional Office Leases from Lease Worksheet (H7)
B-3		Total of Office Leases Scheduled to Expire in Year 1 of Valuation	YES	Sum of Office Leases from Lease Worksheet
B-4	Office Market Rate	Market Rental Rate for Vacant Short Term Office Space for Year 1 of Valuation	NO	
B-5	Potential Gross Income	Market Office Income From Leases to Expire in Year 1 of Valuation	YES	Sum of Office Leases Scheduled to Expire in Year 1 X Office Market Rental Rate
B-6		Effective Office Gross Income From Leases to Expire in Year 1 of Valuation	YES	Potential Gross Income(PGI) - Vacancy Rate
B-7		Estimated Expenses for Office Leases Scheduled to Expire in Year 1 of Valuation	YES	Total Off Leased Area to Expire in Year 1 X Reduced Op Ex X Occupancy Rate
B-8	NOI Loss	EGI Less Estimated Expenses for Office Leases to Expire in Year 1 of Valuation	YES	Effective Gross Income(EGI) - Estimated Expenses
B-9		Income Loss Adjusted for Lease-up Time and Vacate Probability for Year 1 of Valuation	YES	Net Operating Income(NOI) Loss X Lease-up Assumption X Vacate Probability Rate
B-10	Discount Factor	Converts To Present Value(PV)	NO	
B-11		Present Value of Excess Vacancy for Year 1 of Valuation	YES	NOI Loss X Discount Rate
B-12		Present Value of Tenant Improvements for Year 1 of Valuation	YES	Expiring or Vacant Office Space X Occupancy Rate X Tenant Improvement Cost X Vacate Probability X Discount Rate
B-13		Present Value of Leasing Commissions for Year 1 of Valuation	YES	Office Market Rate X Expiring Year 1 Lease Area X Occupancy Rate X Average Commission Rate X 7.5 Years X Discount Rate
B-14		Office Leases Scheduled to Expire in Year 2 of Valuation	NO	
B-15		Additional Office Space to Expire in Year 2 of Valuation	YES	Sum of Additional Year 2 Office Leases from Additional Worksheet (H11)
B-16		Total of Office Leases Scheduled to Expire in Year 2 of Valuation	YES	Sum of Office Leases to Expire in Year 2
B-17	Office Market Rate	Market Rental Rate Adjusted by CPI for Vacant Office Space in Year 2 of Valuation	NO	
B-18	Potential Gross Income	Office Market Income From Leases To Expire in Year 2 of Valuation	YES	Sum of Office Leases Scheduled to Expire in Year 2 X Year 2 Market Rental Rate
B-19		Effective Office Gross Income From Leases to Expire in Year 2 of Valuation	YES	Potential Gross Income - Vacancy Rate
B-20		Estimated Expenses for Office Leases Scheduled to Expire in Year 2 of Valuation	YES	Total Office Leased Space To Expire in Year 2 X Reduced OpEX Rate X Occ Rate
	)I Loss	Effective Gross Income Less Expenses for Office Space to Expire in Year 2 of Valuation	YES	Effective Gross Income - Estimated Expenses
		Income Loss Adjusted for Lease Up Time & Vacate Probability for Year 2 of Valuation	YES	NOI Loss X Leaseup Assumption X Vacate Probability Rate
	scount Rate	Converts To Present Value	NO	
		Present Value of Excess Vacancy for Year 2 of Valuation	YES	NOI Loss X Discount Factor

#	Field Name	Description	Calc	Calculation
B-25		Present Value of Tenant Improvements for Year 2 of Valuation	YES	Year 2 Expiring or Vacant Office Space X Occupancy Rate X Tenant Improvement Cost X Vacate Probality X Discount Rate
B-26		Present Value of Leasing Commissions for Year 2 of Valuation	YES	Office Market Rate X Expiring Year 2 Lease Area X Occupancy Rate X Average Commision Rate X 7.5 YearsX Discount Rate
B-27		Office Leases Scheduled to Expire in Year 3 of Valuation	NO	
B-28		Additional Office Space to Expire in Year 3 of Valuation	YES	Sum of Additional Year 3 Office Leases from Additional Worksheet (H15)
B-29		Total of Office Leases Scheduled to Expire in Year 3 of Valuation	YES	Sum of Office Leases to Expire in Year 3 of Valuation
B-30	Office Market Rate	Market Rental Rate Adjusted by CPI for Vacant Office Space in Year 3 of Valuation	NO	
B-31	Potential Gross Income	Office Market Income From Leases To Expire in Year 3 of Valuation	YES	Sum of Office Leases Scheduled to Expire in Year 3 X Year 3 Market Rental Rate
B-32		Effective Office Gross Income From Leases to Expire in Year 3 of Valuation	YES	Potential Gross Income - Vacancy Rate
B-33		Estimated Expenses for Office Leases Scheduled to Expire in Year 3 of Valuation	YES	Total Office Leased Space To Expire Year 3 X Reduced OpEX Rate X Occupancy Rate
B-34	NOI Loss	EGI Less Expenses for Office Space to Expire in Year 3 of Valuation	YES	Effective Gross Income - Estimated Expenses
B-35		Income Loss Adjusted for Lease Up Time & Vacate Probability for Year 3 of Valuation	YES	NOI Loss X Leaseup Assumption X Vacate Probability Rate
B-36	Discount Rate	Converts To Present Value	NO	
B-37		Present Value of Excess Vacancy for Year 3 of Valuation	YES	NOI Loss X Discount Factor
B-38		Present Value of Tenant Improvements for Year 3 of Valuation	YES	Year 3 Expiring or Vacant Office Space X Occupancy Rate X Tenant Improvement Cost X Vacate Probality X Discount Rate
B-39		Present Value of Leasing Commissions for Year 3 of Valuation	YES	Office Market Rate X Expiring Year 3 Lease Area X Occupancy Rate X Average Commision Rate X 7.5 YearsX Discount Rate
C-1		Present Value of Retail Leasing Commissions for Year 1	YES	Retail Market Rate X Retail Area Expiring in Year 1 X Occupancy % X Commission % X 7.5 Years X Discount Rate
C-2		Retail Excess Vacancy for Year 1	YES	Retail Rental Rate X Area X Occupancy Rate X Leaseup Assumption % X Vacate % X Discount Rate
C-3	Rental Market Rate	Market Rate for Vacant/Short Term Retail Space for Year 1	NO	
C-4		Retail Leases Scheduled to Expire in Year 1	NO	
C-5		Total of Retail Leases Scheduled to Expire in Year 1	YES	Sum of Retail Leases Scheduled to Expire in Year 1
C5a		Additional Retail Area from Additional Revenue Worksheet	YES	Adds Total Area from Additional Revenue Worksheet Section (H-8)
C-6		Present Value of Retail Leasing Commissions for Year 2	YES	Retail Market Rate X Retail Area Expiring in Year 2 X Occupancy % X Commission % X 7.5 Years X Discount Rate
C-7		Retail Excess Vacancy for Year 2	YES	Retail Rental Rate X Area X Occupancy Rate X Leaseup Assumption % X Vacate % X Discount Rate
C-8	Rental Market Rate	Market Rate for Vacant/Short Term Retail Space for Year 2	NO	
C-9		Retail Leases Scheduled to Expire in Year 2	NO	
C-10		Total of Retail Leases Scheduled to Expire in Year 2	YES	Sum of Retail Leases Scheduled to Expire in Year 2
C-10a		Additional Retail Area from Additional Revenue Worksheet	YES	Adds Total Area from Additional Revenue Worksheet Section (H-12)
C-11		Present Value of Retail Leasing Commissions for Year 3	YES	Retail Market Rate X Retail Area Expiring in year 3 X Occupancy % X Commission % X 7.5 Years X Discount Rate
C-12		Retail Excess Vacancy for Year 3	YES	Retail Rental Rate X Area X Occupancy Rate X Leaseup Assumption % X Vacate % X Discount Rate
C-13	Rental Market Rate	Market Rate for Vacant/Short Term Retail Space for Year 3	NO	
C-14		Retail Leases Scheduled to Expire in Year 3	NO	
C-15		Total of Retail Leases Scheduled to Expire in Year 3	YES	Sum of Retail Leases Scheduled to Expire in Year 3
C-15a		Additional Retail Area from Additional Revenue Worksheet	YES	Adds Total Area from Additional Revenue Worksheet Section (H-16)

#	Field Name	Description	Calc	Calculation
D-1	Lease Growth Rate	Selected Yearly Lease Growth Rate	NO	
D-2	Lease-up Assumption	Used to Estimate Excess Vacancy	NO	
D-3	Standard Tenant Improvement	Tenant Improvement Cost Applied to New Leased Space	NO	
D-4	Renewal Tenant Improvement	Tenant Improvement Cost Applied to Renewal Leased Space	NO	
D-5	New Tenant Commission	Leasing Commission Applied to New Leased Space	NO	
D-6	Renewal Commission	Leasing Commission Applied to Renewal Leased Space	NO	
D-7	Vacancy Rate	Selected Vacancy Rate to Determine Effective Gross Income	NO	
D-8	Op Exp Saved Per Square Foot	Expenses Used to Determine NOI Loss for Excess Vacancy	NO	
D-9	Vacate Probability	If Tenant is Leaving 100% is Used This Effects Vacancy, TI's & Leasing Commissions	NO	
D-10	Discount Rate	Used to Calculate Discount Factors	NO	
D-11	Present Value of Excess Vacancy	Sum of Present Value Office Excess Vacancy for Years 1 to 3	YES	Sum of Present Value Office Excess Vacancy for Years 1 to 3
D-12	Present Value of Tenant Improvement's	Sum of Present Value of Office Tenant Improvements for Years 1 to 3	YES	Sum of Present Value of Office Tenant Improvements for Years 1 to 3
D-13	Present Value of Leasing Commissions	Sum of Office Commissions for Years 1 to 3	YES	Sum of Present Value Office Leasing Commissions for Years 1 to 3
D-14	Present Value of Lease-up	Sum of Present Value of Office Excess Vacancy, Tenant Improvements & Commissions	YES	Sum of Present Value of Office Excess Vacancy, Tenant Improvements & Commissions
D-15	Present Value of Leasing Commissions	Sum of Present Value of Retail Leasing Commissions for Years 1 to 3	YES	Sum of Present Value of Retail Commissions for Years 1 to 3
D-16	Excess Vacancy	Sum of Retail Excess Vacancy for Years 1 to 3	YES	Sum of Present Value of Retail Excess Vacancy for Years 1 to 3
D-17	Total Present Value of Retail	Present Value of Total Retail Leasing Commissions & Retail Excess Vacancy	YES	Total of Present Value of Retail Commissions & Retail Excess Vacancy
E-1	NRA	Total Square Footage of Office and Retail	YES	Total of all Square Feet in Section A (Office, Retail, Mezz, Lower Level)
E-2	PGI	Potential Office Mezzanine Retail Gross Income	YES	Total of all Income in Section A (Off, Retail, Mezz and Lower Level)
E-3	Concessions	Enter Lease Concessions	NO	
E-4	Vacancy Rate	Vacancy Percentage	YES	Vacancy from Section D
E-5	Subtotal	Office and Retail Income Minus	YES	Potential Gross Income-Concessions-Vacancy
E-6	Parking	Estimated Parking Income	NO	
E-7	Roof	Typical Antenna Income	NO	
E-8	Storage	Storage Income	NO	
E-9	Other	Other Income	NO	
E-10	Op Expenses	Operating Expenses	NO	
E-11		Operating Expenses Per Square Foot	YES	Operating Expenses divided by Net Rentable Area
E-12	Net Operating Income (NOI)	Net Operating Income	YES	SubTotal Income minus Operating Expenses
E-13	Overall Rate (OAR)	Selected Capitalization Rate	NO	
E-14	Stabilized Value	Value before Any Lease-up Costs	YES	Net Operating Income divided by Overall Rate
E-15	Present Value of Lease-up Cost	Present Value of All Office & Retail Lease-up Cost	YES	Present Value of Office Lease-up Cost + Present Value of Retail Lease-up Cost
E-16	Present Value of Rehab Cost	Present Value of Rehab Cost, PV of Above or Below Market Rent Difference	NO	
E-17	Market Value	Total Estimated Market Value	YES	Stabilized Value minus Present Value of Lease-up Cost minus Present Value of Rehab $
E-18	Value Per Square Foot	Market Value Per Square Foot of Net Rentable Areas (NRA)	YES	Market Value divided by NRA
F-1	Long Term Retail Rent	Continuation from Income Worksheet Of Long Term Retail Rents	NO	
F-2	Long Term Retail Area	Leased Area for Retail Tenants With Long Term Rents	NO	
F-3	Long Term Retail Annual Rent	Annual Rent From Long Term Retail Tenants	YES	Long Term Retail Rent X Leased Square Feet
F-4	Total Long Term Retail Rent	Sum of all Retail Tenants in this Section	YES	Totals all Annual Rents in this Section to be added to Worksheet in Section A7-b
G-1	Long Term Office Rent	Continuation from Income Worksheet Of Long Term Office Rents	NO	
G-2	Long Term Office Area	Leased Area for Office Tenants With Long Term Rents	NO	
G-3	Long Term Office Annual Rent	Annual Rent From Long Term Office Tenants	YES	Long Term Office Rent X Leased Square Feet
G-4	Total Long Term Office Rent	Sum of all Office Tenants in this Section	YES	Totals all Annual Rents in this Section to be added to Worksheet in Section A15-b

#	Field Name	Description	Calc	Calculation
H-1	Office Short Term Area	Continuation from Income Worksheet of Short Term/Vacant Office Area	NO	
H-2	Retail Short Term Area	Continuation from Income Worksheet of Short Term/Vacant Retail Area	NO	
H-3	Total Office Area	Total of all Office Area in this Section	YES	Sums all Short Term or Vacant Office Space in this Section added to A-17
H-4	Total Retail Area	Total of all Retail Area in this Section	YES	Sums all Short Term or Vacant Retail Space in this Section added to A-24
H-5	Office Short Term Year 1	Area of Office Tenants Whose Leases Expire in Year 1	NO	
H-6	Retail Short Term Year 1	Area of Retail Tenants Whose Leases Expire in Year 1	NO	
H-7	Total Office Short Term Year 1	Total Area of Office Tenants Whose Leases Expire in Year 1	YES	Sums Office Area in this Section to be added to Section B-2
H-8	Total Retail Short Term Year 1	Total Area of Retail Tenants Whose Leases Expire in Year 1	YES	Sums Retail Area in this Section to be added to Section C-5a
H-9	Office Short Term Year 2	Area of Office Tenants Whose Leases Expire in Year 2	NO	
H-10	Retail Short Term Year 2	Area of Retail Tenants Whose Leases Expire in Year 2	NO	
H-11	Total Office Short Term Year 2	Total Area of Office Tenants Whose Leases Expire in Year 2	YES	Sums Office Area in this Section to be added to Section B-15
H-12	Total Retail Short Term Year 2	Total Area of Retail Tenants Whose Leases Expire in Year 2	YES	Sums Retail Area in this Section to be added to Section C-10a
H-13	Office Short Term Year 3	Area of Office Tenants Whose Leases Expire in Year 3	NO	
H-14	Retail Short Term Year 3	Area of Retail Tenants Whose Leases Expire in Year 3	NO	
H-15	Total Office Short Term Year 3	Total Area of Office Tenants Whose Leases Expire in Year 3	YES	Sums Office Area in this Section to be added to Section B-28
H-16	Total Retail Short Term Year 3	Total Area of Retail Tenants Whose Leases Expire in Year 3	YES	Sums Retail Area in this Section to be added to Section C-15a
I-1	Office Market Leases Date	Date Signed for Office Market Leases to be Used as Comparables	NO	
I-2	Office Market Leases Rent	Rent per Square Foot for Office Market Leases to be Used as Comparables	NO	
I-3	Office Market Leases Area	Square Foot Area for Office Market Leases to be Used as Comparables	NO	
I-4	Office Market Leases Annual $	Annual Rent for Office Market Leases to be Used as Comparables	YES	Office Area X Market Rent
I-5	Office Market Comps Square and Lot	Square & Lot for Comparable Lease if not from Subject	NO	
I-6	Total Area Office Market Leases	Total Area of Office Leases in this Section	YES	Sums Total Rented Area in this Section
I-7	Total Rent Office Market Leases	Total Rent for Office Leases in this Section	YES	Sums Total Office Annual Rent For This Section
I-8	Weighted Avg Office Market Leases	Average of all Office Leases in this section	YES	Divides Total Annual Rent By Total Office Area For Weighted Average
J-1	Retail Market Leases Date	Date Signed for Retail Market Leases to be Used as Comparables	NO	
J-2	Retail Market Leases Rent	Rent per Square Foot for Retail Market Leases to be Used as Comparables	NO	
J-3	Retail Market Leases Area	Square Foot Area for Retail Market Leases to be Used as Comparables	NO	
J-4	Retail Market Leases Annual $	Annual Rent for Retail Market Leases to be Used as Comparables	YES	Retail Area X Market Rent
J-5	Retail Market Comps Square and Lot	Square & Lot for Comparable Lease if not from Subject	NO	
J-6	Total Area Retail Market Leases	Total Area of Retail Leases in this Section	YES	Sums Total Rented Area in this Section
J-7	Total Rent Retail Market Leases	Total Rent for Retail Leases in this Section	YES	Sums Total Retail Annual Rent For This Section
J-8	Weighted Avg Retail Market Leases	Average of all Retail Leases in this section	YES	Divides Total Annual Rent By Total Retail Area For Weighted Average
K-1	Holding Period in Years	Estimated Holding Period	NO	
K-2	Annual Rate -- Equity Yield	Estimated Annual Equity Rate	NO	
K-3	Annual Rate -- Mortgage	Estimated Annual Mortgage Rate	NO	
K-4	Term of Mortgage in Years	Estimated Term of Mortgage	NO	
K-5	Loan to Value Ratio	Estimated Loan to Value Ratio	NO	
K-6	Change in Property Value: Annual	Estimated Change in Annual Property Value	NO	
K-6a	Change in Property Value: Total	Change in Total Value over Holding Period Based on Estimated Annual %	YES	One Plus Annual Property Percent Increase to the Power of the Holding Period
K-7	Change in Income: Annual	Estimated Change in Annual Income	NO	
K-7a	Change in Income: Total	Change in Total Income Over Holding Period Based on Estimated Annual %	YES	One Plus Annual Income Percent Increase to the Power of the Holding Period
K-8	Weighted Cost of Capital	Determines the Overall Cost Including Equity Yield and Mortgage Rate	YES	1-Loan to Value Ratio x Equity Yield + Mortgage Term X Annual Loan Constant
K-9	Monthly Mortgage Rate	Monthly Mortgage Rate	YES	Mortgage Rate Divided by 12
K-10	Annual Loan Constant -- Full Term	Total Annual Debt Service for the Term of the Mortgage	YES	((Monthly Mortgage Rate Divided By (1+ Monthly Mortgage Rate to the Power of the Mortgage Term in Months) -1)+ Monthly Mortgage Rate) x 12

#	Field Name	Description	Calc	Calculation
K-11	Annual Loan Constant -- Hold Period	Total Annual Debt Service for the Holding Period	**YES**	((Monthly Mortgage Rate Divided By (1+ Monthly Mortgage Rate to the Power of the Holding Period in Months) -1)+ Monthly Mortgage Rate) x 12
K-12	Part Paid Off	Portion of Loan Paid Off During the Holding Period	**YES**	(Annual Loan Constant - Mortgage Rate) divided by (Annual Loan Constant for the Holding Period - Mortgage Rate)
K-13		Step 1 (Equity Yield%to the Power of the Holding Period)	**YES**	(1 + Annual Equity Yield Rate) to the Power of The Holding Period
K-14		Step 2 (Step 1 minus 1)	**YES**	((1 + Annual Equity Yield Rate) to the Power of The Holding Period) - 1
K-15		Step 3 (Step 2 Divided by the Equity Yield)	**YES**	(((1 + Annual Equity Yield Rate) to the Power of The Holding Period) - 1) divided by the Annual Equity Yield)
K-16	Sinking Fund Factor	Sinking Fund is Used to Determine the J-Factor	**YES**	1 divided by((1 + Annual Equity Yield Rate) to the Power of The Holding Period -1)divided by the Annual Equity Yield
K-17	Step 1	Step 1 for Determining the J-Factor-Used When Income Growth is Expected	**YES**	1- (1 divided by (1 + Equity Yield) to the Power of the Holding Period)
K-18	Step 2	Holding Period Divided by Step 1	**YES**	Holding Period/(1- (1 / (1 + Equity Yield) to the Power of the Holding Period)
K-19	Step 3	Step 2 Minus Inverse of Equity Yield	**YES**	Holding Period/(1- (1 / (1 + Equity Yield) to the Power of the Holding Period) minus (1 divided by the Equity Yield Rate)
K-20	J-Factor	J-Factor-used in Determining Cap Rates when Income Growth is Expected Step 2 times Sinking Fund	**YES**	(Holding Period/(1- (1 / (1 + Equity Yield) to the Power of the Holding Period) minus (1 divided by the Equity Yield Rate)) X Sinking Fund
K-21	Loan Ratio x Annual Constant	Mortgage Portion of Overall Rate- in Mortgage Equity Cap Rate	**YES**	Loan Ratio x Annual Constant
K-22	Equity Ratio x Equity Yield Rate	Equity Portion of Overall Rate- in Mortgage Equity Cap Rate	**YES**	Equity Ratio x Equity Yield Rate
K-23	Loan Ratio x PP Off x SF Factor	Part of Overall Rate- Accounts for Portion of Loan Paid Off in Holding Period	**YES**	Loan Ratio x Part Paid Off x Sinking Fund Factor
K-24	Adjustment for Change in Property Value	Part of Overall Rate- Accounts for Increase in Property Value	**YES**	Total Annual Property Value Increases Over Holding Period x Sinking Fund
K-25	J-Factor	Part of Overall Rate- Accounts for Increase in Income during Holding Period	**YES**	1 divided by Total annual Income Increase over Holding Period X J Factor
K-26	OAR before Adding Real Estate Tax Rate	Overall Capitalization Rate ((K21+K22)-K23-K24)*K25	**YES**	Loan Ratio x Annual Constant+Equity RatioxEquity Yield Rate-Part Of Mortgage Paid Off - Annual Property Increase x Sinking Fund x J Factor
K-27	Effective Rate of Taxation	Added to Overall Rate for Tax Loaded Cap Rate	**NO**	
K-28	OAR Loaded for Real Estate Taxes	Real Estate Tax Loaded Capitalization Rate	**YES**	Adds Effective Tax Rate to Overall Capitalization Rate
L-1	Discount Rate	Discount Rate Used to Estimate Present Value of Losses	**NO**	
L-2	Estimated Loss	Year 1 of Loss of Estimated Loss, Capitalized Expense or Excess Rent	**NO**	
L-3	Present Value Factor	Present Value Formula for Discount Rate in L1	**YES**	Present Value Formula for Discount Rate in L1
L-4	Present Value of Loss(es)	Present Value times Annual Loss	**YES**	Present Value times Annual Loss
L-5	Total Present Value of Losses	Totals Present Value of Losses	**YES**	Totals Present Value of Losses Over Holding Period
